Euscorpius

Occasional Publications in Scorpiology

EDITOR: Victor Fet, Marshall University, ‘fet@marshall.edu’
ASSOCIATE EDITOR: Michael E. Soleglad, ‘msoleglad@gmail.com’

Euscorpius is the first research publication completely devoted to scorpions (Arachnida: Scorpiones). Euscorpius takes advantage of the rapidly evolving medium of quick online publication, at the same time maintaining high research standards for the burgeoning field of scorpion science (scorpiology). Euscorpius is an expedient and viable medium for the publication of serious papers in scorpiology, including (but not limited to): systematics, evolution, ecology, biogeography, and general biology of scorpions. Review papers, descriptions of new taxa, faunistic surveys, lists of museum collections, and book reviews are welcome.

Derivatio Nominis

The name Euscorpius Thorell, 1876 refers to the most common genus of scorpions in the Mediterranean region and southern Europe (family Euscorpiidae).

Euscorpius is located at: https://mds.marshall.edu/euscorpius/
Archive of issues 1-270 see also at: http://www.science.marshall.edu/fet/Euscorpius

(Marshall University, Huntington, West Virginia 25755-2510, USA)

ICZN COMPLIANCE OF ELECTRONIC PUBLICATIONS:

Electronic (“e-only”) publications are fully compliant with ICZN (International Code of Zoological Nomenclature) (i.e. for the purposes of new names and new nomenclatural acts) when properly archived and registered. All Euscorpius issues starting from No. 156 (2013) are archived in two electronic archives:

- Biotaxa, http://biotaxa.org/Euscorpius (ICZN-approved and ZooBank-enabled)
- Marshall Digital Scholar, http://mds.marshall.edu/euscorpius/. (This website also archives all Euscorpius issues previously published on CD-ROMs.)

Between 2000 and 2013, ICZN did not accept online texts as “published work” (Article 9.8). At this time, Euscorpius was produced in two identical versions: online (ISSN 1536-9307) and CD-ROM (ISSN 1536-9293) (laser disk) in archive-quality, read-only format. Both versions had the identical date of publication, as well as identical page and figure numbers. Only copies distributed on a CD-ROM from Euscorpius in 2001-2012 represent published work in compliance with the ICZN, i.e. for the purposes of new names and new nomenclatural acts.

In September 2012, ICZN Article 8. What constitutes published work, has been amended and allowed for electronic publications, disallowing publication on optical discs. From January 2013, Euscorpius discontinued CD-ROM production; only online electronic version (ISSN 1536-9307) is published. For further details on the new ICZN amendment, see http://www.pensoft.net/journals/zookeys/article/3944/.

Chaerilus alberti sp. n. from Malaysia (Scorpiones: Chaerilidae)

František Kovařík

P.O. Box 27, CZ - 145 01 Praha 45, Czech Republic; www.scorpio.cz

Summary

Chaerilus alberti sp. n. from Malaysia (Cameron Highlands) is described and fully illustrated with color photographs of preserved specimens, as well as of their habitat. Males of C. alberti sp. n. have a unique shape of chela which is stout with the manus swollen anteriorly. They are compared to other species from Southeast Asia from all of which C. alberti sp. n. differs by the shape of pedipalp chela parallel or swollen posteriorly or medially. Pedipalp chela is illustrated with color photographs of 21 of these species.

Introduction

Chaerilidae comprise a small, rather homogeneous, monotypic family of scorpions widely distributed across the continent and archipelagoes of tropical southern Asia (Kovařík et al., 2018). Here, another new species is described, characterised by a unique shape of the pedipalp chela in male, which has a manus swollen anteriorly. Presented Figures 37–58 show that this sole character distinguishes Chaerilus alberti sp. n. from all other species of genus Chaerilus. These figures also show that the shape of chela helps to recognize individual species or species groups in combination with three other characters which are extremely variable within the genus Chaerilus in comparison with other scorpion genera. These characters are: total length from 16 mm (C. sejnai Kovařík, 2005) to 80 mm (C. tichyi Kovařík, 2000); pedipalp chela movable fingers with 7 (C. celebensis Pocock, 1894) to 16 (C. majkusi Kovařík et al., 2018) imbricated rows of granules; pedipalp chela fingers in males straight (as in C. solegladi Kovařík, 2012) or flexed (as in C. robinsoni Hirst, 1911).

Methods, Material & Abbreviations

Nomenclature and measurements follow Stahnke (1971), Kovařík (2009), and Kovařík & Ojanguren Affilastro (2013), except for trichobothriotaxy (Vachon, 1974).

Depositories: AMNH (American Museum of Natural History, New York, USA); BMNH (The Natural History Museum, London, United Kingdom); FKCP (František Kovařík, private collection, Prague, Czech Republic); NHRS (Naturhistoriska Riksmuseet, Stockholm, Sweden).

Biometrics: L, length; W, width; D, depth.

Systematics

Family Chaerilidae Pocock, 1893

Chaerilus Simon, 1877

(Figs. 1–58, Table 1)

Type species. Chaerilus variegatus Simon, 1877.

Diagnosis. Total length 16–80 mm; Orthobothriotaxy type B; pedipalp femoral $d_3-d_4$ trichobothria configuration points toward dorsoexternal carina; pedipalp patella with three ventral trichobothria and pedipalp femur with 9 trichobothria, 4 of them dorsal; cheliceral fixed finger with median and basal denticles flush on surface, not fused into bicusp; ventral edge of cheliceral movable finger with median and basal denticles flush on surface, not fused into bicusp; ventral edge of cheliceral movable finger crenulated, dorsal edge with single subdistal denticle; ventral surface of cheliceral fixed finger with four denticles; dorsal edge of cheliceral movable finger with a single subdistal denticle; ventral surface of cheliceral fixed finger with four denticles; sternum, type 1, exhibits subtle wide horizontal compression; maxillary lobes 1 spatulate; hemispermatophore is fusiform; median denticle row (MD) of pedipalp chela finger arranged in oblique groups; pedipalp...

Table 1. Comparative measurements of *Chaerilus alberti* sp. n. types. Abbreviations: length (L), width (W, in carapace it corresponds to posterior width), depth (D).

Chela exhibits “8-carina” configuration; legs without tibial spurs, but with prolateral and retrolateral pedal spurs; tarsi of legs bear two or four rows of ventral setae and median row of spinules; fifth metasomal segment with a single ventral carina; telson without subocular tubercle.

*Chaerilus alberti* sp. n.
(Figs. 1–37, Table 1)

**Type locality and type repository.** Malaysia, Perak, Cameron Highlands, Tanah Rata env., Gunung Jasar, 04°28’41.876”N 101°21’37.141”E, ca 1600 m a. s. l., FKCP.

**Type material.** *Malaysia, Perak, Cameron Highlands, Tanah Rata env., Gunung Jasar, 04°28’41.876”N 101°21’37.141”E, ca 1600 m a. s. l. (Figs. 34–35), 12.X.2018, 2♂ (holotype and paratype, No. 1585), sifting montane cloud forest, leg. A. Albert, FKCP; Pahang/Perak border, Cameron Highlands, Tanah Rata env., Gunung Brinchang, 04°31’17.8”N 101°22’53.9”E , ca 2000 m a. s. l. (Fig. 36), 14.X.2018, 1♀ (paratype), sifting montane cloud forest, leg. A. Albert, FKCP.*

**Etymology.** The selected epithet is a patronym honoring A. Albert, the collector of types of the new species. He is also the author of the photographs of localities (Figs. 34–36).

**Diagnosis.** Total length 21–25.2 mm. Two or three pairs of lateral eyes and one pair of median eyes. Male differs from female in having pedipalp chela much wider with manus swollen anteriorly. Chela length/width ratio in male 2.265; in female 2.95. Movable finger of pedipalp with 7–8 imbricated granule rows. Fingers straight in both sexes. Chela of pedipalp with 8 carinae. Pectinal teeth number 5 in males, 3 in female. Carapace and mesosomal tergites granulated. All sternites smooth without carinae and granules. Glabrous zone on posterior part of sternite V present medially. First metasomal segment with 10 carinae, second to fourth segments with 8 carinae, but all carinae are smooth, several solitary granules can be present only on dorsal carinae. Metasoma I–IV smooth.

**Description.** Total length 21–25.2 mm. Two or three pairs of lateral eyes and one pair of median eyes. Male differs from female in having pedipalp chela much wider with manus swollen anteriorly. Chela length/width ratio in male 2.265; in female 2.95. Movable finger of pedipalp with 7–8 imbricated granule rows. Fingers straight in both sexes. Chela of pedipalp with 8 carinae. Pectinal teeth number 5 in males, 3 in female. Carapace and mesosomal tergites granulated. All sternites smooth without carinae and granules. Glabrous zone on posterior part of sternite V present medially. First metasomal segment with 10 carinae, second to fourth segments with 8 carinae, but all carinae are smooth, several solitary granules can be present only on dorsal carinae. Metasoma I–IV smooth.

**Coloration** (Figs. 1–4). The color is reddish black to black, legs and telson yellowish brown.

**Carapace and mesosoma** (Figs. 5–8). The carapace is partly covered by granules that do not form carinae and are absent...
from two strips in the median area. The anterior margin of the carapace is almost straight to weakly concave. The mesosomal tergites are irregularly granulated. All sternites are smooth without carinae and granulation. Sternite V with glabrous zone on posterior part of sternite V present medially. Pectinal teeth number 5 in males, 3 in female.

**Metasoma and telson** (Figs. 15–22). The first metasomal segment bears 10 carinae, the metasoma II–IV bear eight carinae, and the fifth segment bears five carinae. All carinae except metasoma V ventral are smooth and weak without granules. Several solitary granules can be only on dorsal carinae. The three ventral carinae on metasoma V granulated; the ventral median carina posteriorly branches in a “Y” configuration. The spaces between carinae are smooth, only ventral surface of metasoma V is partly granulated. All segments are very sparsely hirsute. The telson is elongate, smooth and very sparsely hirsute.

Pedipalps (Figs. 23–32). The pedipalp chela is stout, with anteriorly swollen manus in the male. The movable and fixed fingers bear 7–8 imbricated rows of granules. Fingers are straight in both sexes. The chela has eight mostly granulated carinae. The surfaces of chela with reticulate granulation patterns. The patella is smooth with dorsal carina developed and granulated, other carinae are absent or weakly indicated. The femur has four carinae and is finely granulated mainly on dorsal surface.

Legs (Figs. 9–12). The legs are smooth, sparsely hirsute, without bristlecombs and carinae. The tarsomeres bear four rows of spiniform setae. Spiniform setal formula of inner rows is 7–8/7–8; 8–9/8–10; 9–10/9–10; of outer rows is 6–9/6–9 on all legs.

Affinities. Chaerilus alberti sp. n. is reliably distinguished from all other Chaerilus species by the unique shape of chela which is stout with anteriorly swollen manus in the male (Fig. 37). Other Chaerilus species have manus of pedipalp chela parallel-sided in shape or swollen posteriorly or medially (Figs. 38–58). Other main taxonomically important characters are total length 21–25.2 mm; chela length/width ratio in males 2.265; movable and fixed fingers with 7–8 imbricated rows of granules; fingers are straight in both sexes; metasoma I–IV smooth without granules; sternite V with glabrous zone on the posterior part of sternite V in male; the measurements cited in Table 1.
