Scorpions of the Horn of Africa (Arachnida, Scorpiones). Part XX.

*Barbaracurus feti* sp. n.
from Somaliland (Buthidae)

František Kovařík, Graeme Lowe, František Šťáhlavský & Ali Abdi Hurre

May 2019 — No. 280
Euscorpius

Occasional Publications in Scorpiology

EDITOR: Victor Fet, Marshall University, ‘fet@marshall.edu’
ASSOCIATE EDITOR: Michael E. Soleglad, ‘msoleglad@gmail.com’

Euscorpius is the first research publication completely devoted to scorpions (Arachnida: Scorpiones). Euscorpius takes advantage of the rapidly evolving medium of quick online publication, at the same time maintaining high research standards for the burgeoning field of scorpion science (scorpiology). Euscorpius is an expedient and viable medium for the publication of serious papers in scorpiology, including (but not limited to): systematics, evolution, ecology, biogeography, and general biology of scorpions. Review papers, descriptions of new taxa, faunistic surveys, lists of museum collections, and book reviews are welcome.

Derivatio Nominis

The name Euscorpius Thorell, 1876 refers to the most common genus of scorpions in the Mediterranean region and southern Europe (family Euscorpiidae).

Euscorpius is located at: https://mds.marshall.edu/euscorpius/
Archive of issues 1-270 see also at: http://www.science.marshall.edu/fet/Euscorpius

(Marshall University, Huntington, West Virginia 25755-2510, USA)

ICZN COMPLIANCE OF ELECTRONIC PUBLICATIONS:

Electronic (“e-only”) publications are fully compliant with ICZN (International Code of Zoological Nomenclature) (i.e. for the purposes of new names and new nomenclatural acts) when properly archived and registered. All Euscorpius issues starting from No. 156 (2013) are archived in two electronic archives:

- Biotaxa, http://biotaxa.org/Euscorpius (ICZN-approved and ZooBank-enabled)
- Marshall Digital Scholar, http://mds.marshall.edu/euscorpius/. (This website also archives all Euscorpius issues previously published on CD-ROMs.)

Between 2000 and 2013, ICZN did not accept online texts as “published work” (Article 9.8). At this time, Euscorpius was produced in two identical versions: online (ISSN 1536-9307) and CD-ROM (ISSN 1536-9293) (laser disk) in archive-quality, read-only format. Both versions had the identical date of publication, as well as identical page and figure numbers. Only copies distributed on a CD-ROM from Euscorpius in 2001-2012 represent published work in compliance with the ICZN, i.e. for the purposes of new names and new nomenclatural acts.

In September 2012, ICZN Article 8. What constitutes published work, has been amended and allowed for electronic publications, disallowing publication on optical discs. From January 2013, Euscorpius discontinued CD-ROM production; only online electronic version (ISSN 1536-9307) is published. For further details on the new ICZN amendment, see http://www.pensoft.net/journals/zookeys/article/3944/.

Publication date: 22 May 2019

http://zoobank.org/urn:lsid:zoobank.org:pub:D658FFB4-3E47-46BA-998D-F8643D2DE70D
Introduction

The genus Barbaracurus Kovařík, Lowe et Šťáhlavský, 2018 with type species Babycurus sofomarensis Kovařík et al., 2015, was recently defined and compared with the genus Babycurus Karsch, 1886 by Kovařík et al., 2018. Subsequent research in Somaliland led to the discovery of another new species from that country, described herein.

Methods, Material & Abbreviations

Nomenclature and measurements follow Stahnke (1971), Kovařík (2009), and Kovařík & Ojanguren Affilastro (2013), except for trichobothriotaxy (Vachon, 1974) and hemispermatophore morphology (Kovařík et al., 2018).

Karyotype analyses were based on chromosome preparations prepared by the spreading technique which is frequently used in scorpions (e.g. Kovařík et al., 2009; Plíšková et al., 2016). The chromosomes were stained by 5% Giemsa solution in Sörensen phosphate buffer for 20 min. Five spermatocyte nuclei were measured using the software Image J 1.45r (http://rsbweb.nih.gov/ij) with the plugin Levan (Sakamoto & Zacaro, 2009).

Depositories: FKCP (František Kovařík, private collection, Prague, Czech Republic), GLPC (Graeme Lowe, private collection, Philadelphia, USA).

Systematics

Family Buthidae C. L. Koch, 1837

Barbaracurus Kovařík, Lowe et Šťáhlavský, 2018

(Figs. 1–46, Table 1)

Diagnosis (after Kovařík et al., 2018). Small to medium buthids, adults 22–47 mm. Carapace granular, lacking distinct carinae, flat, subrectangular with concave anterior margin. Median eyes on low ocular tubercle in anterior half of carapace; usually with 4, or sometimes 5 pairs of lateral eyes (3 major ocelli, 1–2 minor ocelli). Anterior, central and posterior median furrows distinct, connected by median groove running over ocular tubercle. Sternum type 1, triangular in shape. Tergites I–VI granular, with single median carina which may be obsolete on I–II, tergite VII with 5 carinae. Metasoma elongate, segment I with 10 carinae, II–IV with 8 carinae, lacking lateral median carina. Metasoma V convex, sometimes dilated, carinae present or obsolete. Telson ellipsoidal, pyriform or slightly bulbous, with distinct subaculear tooth. Pectines with fulcra. Hemispermatophore capsule with 2-lobed sperm hemiduct and an oblique carinate or scoop-like basal lobe. Chelicerae with

Summary

Barbaracurus feti sp. n. from Somaliland is described and compared with other species of the genus. Additional information is provided on the taxonomy and distribution of the genus Barbaracurus, fully complemented with color photos of specimens of both sexes of the new species, as well as of their habitat. In addition to morphology and hemispermatophores, we also describe the karyotypes of B. feti sp. n. (2n=23). Included is a key for Barbaracurus. Babycurus borellii Rossi, 2019 is synonymized with Barbaracurus yemenensis Kovařík et al., 2018 syn. n. as a junior synonym because the description dated in February 2018 was in reality published/accessible in March 2019.
typical buthid dentition, fixed finger armed with two denticles on ventral surface. Pedipalps orthobothriotaxic, type Aβ, femur trichobothrium d₂ internal, patella d₃ external to dorsomedian carina, chela d₅ in distal half of fixed finger. Chela manus smooth, with carinae reduced or obsolete, dentate margins of chela movable finger armed with 6–7 non-imbricated, almost linear or contiguous rows of denticulate granules, each row terminated proximally by an enlarged granule flanked by adjacent single internal and external accessory granules. Most proximal granule row without internal accessory denticle, and either with (species from Horn of Africa and Arabian Peninsula) or without (species from Cameroon and Nigeria) a single isolated external accessory granule midway along its length. Pedipalp chelae sexually dimorphic, males typically with manus dilated and fingers proximally undulate on dentate margins, denticles of proximal granule rows bicuspid. Tibial spurs absent on leg III, present on leg IV, tibia and tarsus III–IV without bristle combs, ventral surfaces of tarsi equipped with two rows of setae, ungues stout.

**Table 1.** Comparative measurements of adults of *Barbaracurus feti* sp. n. Abbreviations: length (L), width (W, in carapace it corresponds to posterior width), depth (D).

**Type locality and type depository.** Somaliland, Rugay village, between Erigavo and Maid, 10°50′46″N 47°18′23″E, 428 m a.s.l.; FKCP.

**Type material examined.** Somaliland, Rugay village, between Erigavo and Maid, 10°50′46″N 47°18′23″E, 428 m a.s.l. (Locality No. 18SE), 24.VIII.2018, 1♂ (holotype No. 1528) 1♀ 1 juv. (paratypes), leg. F. Kovařík, FKCP, GLPC.

**Etymology.** The specific epithet honors Victor Fet (Marshall University, USA) for his friendship and lifelong dedication to scorpions.

**Diagnosis.** Total length of adult male 31.25 mm, adult female 38.80 mm. Coloration pale yellow to light orange, chelicerae yellow without reticulation. Pedipalp chela manus wider in male than female, chela length/width ratio 4.38 in male and 5.55 in female; proximal margins of pedipalp fingers of female straight, of male weakly undulate with very small gap with fingers closed (Fig. 18); dentate margin of movable finger armed with 6 rows of granules, and a short apical row of 3 denticles (Fig. 26); most proximal granule row with one external accessory granule. Pectines with 25–27 teeth in both
Kovařík, Lowe, Šťáhlavský & Hurre: *Barbaracurus feti* sp. n. from Somaliland

Figures 1–4: *Barbaracurus feti* sp. n. Figures 1–2. Holotype male, dorsal (1) and ventral (2) views. Figures 3–4. Paratype female, dorsal (3) and ventral (4) views. Scale bar: 10 mm.
sexes. Hemispermatophore basal lobe a short oblique lamina, length ca. half of basal width of posterior lobe. Metasoma narrow, metasoma V length/width ratio 2.52 in male and 2.66 in female; metasoma I with 10 carinae, II–IV with 8 carinae. Telson setose, bearing numerous long macrosetae and short, pointed subaculear tubercle; vesicle smooth, elongate, ellipsoidal or weakly pyriform in lateral profile, telson length/depth ratio 3.24 in both sexes; aculeus slender, curved, shorter than vesicle.

**Description.** Total length of adults 31.25 (male) – 38.80 mm (female). Measurements of the carapace, telson, segments of the metasoma and pedipalps are given in Table 1. Base color is pale yellow to light orange (Figs. 1–4), metasoma V is dark. Chelicerae are yellow without reticulation (Figs. 13–14). **Sexual dimorphism** minor, adult male with wider pedipalp chela than female, pedipalp chela length/width ratio 4.38 in male and 5.55 in female; pedipalps fingers are shorter in males, the fingers of females are straight, while those of males are weakly undulate proximally; no sexual difference in length and width of metasomal segments.

**Pedipalp** (Figs. 15–27). Pedipalp mostly very sparsely hirsute, but more densely so on ventral surface of movable finger. Femur granulated, with five granulose carinae. Patella almost smooth with seven granulose carinae developed. Chela smooth with traces of carinae visible; fingers long, curved; movable finger with 6 granule rows and short apical row of 4 denticles on dentate margins, the most proximal row with one external and no internal accessory granule; fixed finger with 7 granule rows.

**Carapace** (Figs. 5–6). Slightly trapezoidal (narrower anteriorly) and slightly longer than wide; anterior margin concave, with some short macrosetae. Carination absent. Median and posterior lateral furrows wide and deep, others vestigial to absent. Tegument densely and coarsely granulose. Median eyes large and raised; four or five pairs of lateral eyes: three major ocelli aligned along each anterolateral corner, plus two minor ocelli that may be vestigial or absent.

**Mesosoma** (Figs. 1–4, 5–8). Tergites I–VI bear a single conspicuous median carina; tergite VII bears five well-defined carinae (median, submedians and laterals), which are long and serrate to crenulate. All tergites densely and coarsely granulose mainly on posterior parts. Sternum type 1, triangular in shape; medial depression large. Pectines extending to around a quarter of sternite V in male and a quarter of sternite IV in female. Tooth count 25–26 in male and juvenile, and 27 in female. Pectines with 3 marginal lamellae and 8–9 middle lamellae. Sternites lacking carinae, surfaces smooth and sparsely setose. Posterior margin of sternite V without smooth median patch in both sexes. Sternite VII with four well-defined carinae, which are long and serrate to crenulate.

**Hemispermatophore** (Figs. 38–42). Flagelliform. Trunk long, narrow, gradually widening basally. Capsule short, its length measured from basal lobe only 11% of trunk length. Flagellum...
narrow, slightly tapered, pars recta 45% of trunk length, pars reflecta is truncated in the available material. Sperm hemiduct with 2 elongated lobes, posterior lobe longer with broad base, subtriangular with distinct carina, apex blunt; anterior lobe shorter, constricted at base, separated from posterior lobe by small notch or aperture at base. Basal lobe a short lamina, prominently projecting from convex surface of capsule, oriented along oblique, transverse axis from anterior base of posterior lobe. Lamina length is about half of the basal width of the posterior lobe, similar to the shorter laminae of *B. zambonelli* and *B. somalicus* (cf. figs. 27–28, 35–36 in: Kovařík et al., 2018). Notably, these three allopatric species are distributed adjacently along the coastal region of the Horn of Africa.

Legs (Figs. 9–12). Tarsomeres bearing two rows of macrosetae on their ventral surface and numerous macrosetae on other surfaces; bristle combs absent. Femur bearing only solitary macrosetae. Femur surface coarsely granulose, femur and patella with carinae developed. Moderate tibial spurs present on leg IV.

Metasoma and telson (Figs. 28–35). Segments I–IV with granulate, completely developed carinae, segment V with carinae indicated in both sexes. The carinae are composed of minute, rounded, equal-sized, evenly spaced granules. The first metasomal segment has a total of 10 carinae, the second through fourth segments have eight carinae, and the fifth segment has five indicated carinae. All metasomal

Arrows show one extra large odd chromosome. Scale bar: 5 μm.
Figures 45–46: Figure 45. Map showing confirmed distribution of Barbaracurus spp. For exact position of Rugay village, the type locality of Barbaracurus feti sp. n. see fig. 84 in Kovařík et al., 2019. Figure 46. Barbaracurus feti sp. n., type locality.
segments are very sparsely granulated. Metasoma is very sparsely hirsute. Telson smooth with only a weakly indicated ventral carina and a dense cover of long setae mainly on the ventral surface. Subaculear tubercle short and pointed. Vesicle elongate, ellipsoidal or pyriform, telson length/depth ratio 3.24 in both sexes. Aculeus slender, curved, shorter than vesicle.

**Key to species of Barbaracurus**

1 Pedipalp movable finger without an external accessory granule midway along most proximal granule row. .... 2
   - Pedipalp movable finger with an external accessory granule midway along most proximal granule row. .... 3

2 Base color uniformly yellow or orange, without any darker markings; sternite VII with very weak carination ............. ................................................. *B. prudenti* (Lourenço, 2013)
   - Base color yellow with brown spots on carapace, dark stripes on tergites, dark pedipalp patella and metasoma V; sternite VII with 4 well developed carinae ............ ................................................. *B. ugartei* (Kovařík, 2000)

3 Pedipalp movable finger with 6 rows of granules. ....... 4
   - Pedipalp movable finger with 7 rows of granules. ....... 7

4 Pedipalp chela with narrower manus, chela length/width ratio 4.3–5.6, finger margins weakly undulate at base, not leaving gap when closed (Figs. 16 and 18, and figs. 81, 84, 86 in Kovařík et al., 2015) ....................................................... 5
   - Pedipalp chela with broader manus, chela length/width ratio 3.4–4.2, finger margins strongly undulate at base, leaving wide gap when closed ................................................... 6

5. Total length 22.5 mm in male, 32.1–32.25 mm in females; pectines with 16–17 teeth in both sexes; distributed in Ethiopia and Somalia. *B. subpunctatus* (Borelli, 1925)
   - Total length 31.25 mm in male, 38.80 mm in female; pectines with 25–27 teeth in both sexes; distributed in Somaliland. ................................................. *B. feti* sp. n.

6 Telson vesicle pyriform in lateral profile, deeper anteriorly (figs. 83–84 in Kovařík et al., 2018); telson length/depth ratio 2.75–2.89; pedipalp movable finger of female very weakly undulate at base. ...... *B. somalicus* (Hirst, 1907)
   - Telson vesicle symmetric in lateral profile (figs. 76–77 in Kovařík et al., 2015); telson length/depth ratio 2.60–2.73; pedipalp movable finger of female moderately undulate at base. ............... *B. sofomarensis* (Kovařík et al., 2015)

7 Pedipalp chela with broader manus (figs. 58, 60 in Kovařík et al., 2018), chela length/width ratio 4.28 (♀), 3.42 (♂); telson more bulbous, length/depth ratio 2.27–2.37 (♀, ♂); distributed in Africa. ...... *B. zambonellii* (Borelli, 1902)
   - Pedipalp chela with narrower manus (figs. 62, 64, 66, 68, 210, 212 in Kovařík et al., 2018), chela length/width ratio 4.73–6.12 (♀, ♂); telson ellipsoidal or pyriform, length/depth ratio 2.63–2.89 (♀); distributed in Arabia............. 8

8 Telson more slender (figs. 81–82 in Kovařík et al., 2018), length/depth ratio 2.89 (♀), 2.70 (♂); found in Al Hajar mountains of northern Oman. ... *B. exquisitus* (Lowe, 2000)
   - Telson less slender (figs. 85–87 in Kovařík et al., 2018), length/depth ratio 2.63–2.72 (♀); not found in northern Oman .............................................. 9

9 Larger size, 40–42 mm (♀); less slender metasoma, metasoma V length/width ratio 2.30–2.46 (♀) ................. ................................................. *B. yemenensis* Kovařík et al., 2018
   - Smaller size, 30–34 mm (♀), 25–29 mm (♂); more slender metasoma, metasoma V length/width ratio 2.56–2.58 (♀) ............................................. *B. winklerorum* Kovařík et al., 2018

Acknowledgments.

Thanks are due to Petra Frýdlová, Daniel Frynta, David Král, Petr Kabátek, Tomáš Mazuch and David Sommer (Czech Republic), Abdiqaadir Abdirahim and Abdisalan Sheabele (Republic of Somaliland) who participated and helped in
the expeditions to Somaliland. Special thanks to Mohamud Yousuf Muse (President of University of Hargeisa), Mohamed A. Sulub (Director, Corporate Communication Directorate, University of Hargeisa), Suleman Ahmed Gulair (President of Amoud University), Ahmed A. Boqore (Vice President, Academic Affairs of Amoud University), Shukuri Haji Ismail and Abdinasir Hussein (Ministry of Environment & Rurar Development, Hargeisa, Republic of Somaliland), and residents of Rugay village (Somaliland) for their help. Further, we thank two anonymous reviewers for their comments on the manuscript.
