March 2020 — No. 303
Euscorpius
Occasional Publications in Scorpiology

EDITOR: Victor Fet, Marshall University, ‘fet@marshall.edu’
ASSOCIATE EDITOR: Michael E. Soleglad, ‘msoleglad@gmail.com’
TECHNICAL EDITOR: František Kovařík, ‘kovarik.scorpio@gmail.com’

Euscorpius is the first research publication completely devoted to scorpions (Arachnida: Scorpiones). Euscorpius takes advantage of the rapidly evolving medium of quick online publication, at the same time maintaining high research standards for the burgeoning field of scorpion science (scorpiology). Euscorpius is an expedient and viable medium for the publication of serious papers in scorpiology, including (but not limited to): systematics, evolution, ecology, biogeography, and general biology of scorpions. Review papers, descriptions of new taxa, faunistic surveys, lists of museum collections, and book reviews are welcome.

Derivatio Nominis

The name Euscorpius Thorell, 1876 refers to the most common genus of scorpions in the Mediterranean region and southern Europe (family Euscorpiidae).

Euscorpius is located at: https://mds.marshall.edu/euscorpius/
Archive of issues 1-270 see also at: http://www.science.marshall.edu/fet/Euscorpius

(Marshall University, Huntington, West Virginia 25755-2510, USA)

ICZN COMPLIANCE OF ELECTRONIC PUBLICATIONS:

Electronic (‘e-only’) publications are fully compliant with ICZN (International Code of Zoological Nomenclature) (i.e. for the purposes of new names and new nomenclatural acts) when properly archived and registered. All Euscorpius issues starting from No. 156 (2013) are archived in two electronic archives:

• Biotaxa, http://biotaxa.org/Euscorpius (ICZN-approved and ZooBank-enabled)
• Marshall Digital Scholar, http://mds.marshall.edu/euscorpius/. (This website also archives all Euscorpius issues previously published on CD-ROMs.)

Between 2000 and 2013, ICZN did not accept online texts as “published work” (Article 9.8). At this time, Euscorpius was produced in two identical versions: online (ISSN 1536-9307) and CD-ROM (ISSN 1536-9293) (laser disk) in archive-quality, read-only format. Both versions had the identical date of publication, as well as identical page and figure numbers. Only copies distributed on a CD-ROM from Euscorpius in 2001-2012 represent published work in compliance with the ICZN, i.e. for the purposes of new names and new nomenclatural acts.

In September 2012, ICZN Article 8. What constitutes published work, has been amended and allowed for electronic publications, disallowing publication on optical discs. From January 2013, Euscorpius discontinued CD-ROM production; only online electronic version (ISSN 1536-9307) is published. For further details on the new ICZN amendment, see http://www.pensoft.net/journals/zookeys/article/3944/

Publication date: 15 March 2020

A new species of *Vaejovis* from Mingus Mountain, northern Arizona (Scorpiones: Vaejovidae)

Richard F. Ayrey

P. O. Box 2236, Flagstaff, Arizona 86004, USA; email: flagrich@azscorpion.com

http://zoobank.org/urn:lsid:zoobank.org:pub:B01260F2-C164-4DF5-A70D-8BE46189179A

**Summary**

A new scorpion species, *Vaejovis elii* sp. n., is described. This small, dark brown species is found on Mingus Mountain, Yavapai County, northern Arizona, USA. It is geographically closest to *V. crumpi* Ayrey & Soleglad. We compare it to that species and two other species found in northern Arizona. The pedipalp fixed finger has 6 ID denticles and the movable finger has 7, like in most, but not all, of the other northern Arizona *Vaejovis*. Carapace of female is longer than metasomal segment V.

**Introduction**

Including the new species described in this paper from Mingus Mountain, Arizona, there are now 22 “vorhiesi” group scorpions in Arizona, western New Mexico (USA) and northern Sonora (Mexico). Most of these scorpions live in Ponderosa Pine forests or pine oak woodlands (Ayrey, 2009, 2018; Ayrey & Soleglad, 2011; Ayrey & Myers, 2019), as does *Vaejovis elii* sp. n.

The type locality of *V. elii* sp. n. is at the top of Mingus Mountain, along the canyon of the Verde River, which separates it from *V. lapidicola* and *V. jonesi*. It is also separated from *V. crumpi* by the Prescott Valley and the Bradshaw Mountains. See map (Fig. 21) for locations.

This species was one of the subjects of an ABC Nightline news segment on scorpions, which was aired on 28 September 2016. It can be viewed on Youtube.com via the following link: https://www.youtube.com/watch?v=H-B0YhGt9u4

**Methods, Material & Abbreviations**

Measurements are as described in Stahnke (1971), trichobothrial patterns are as in Vachon (1974), and pedipalp finger dentition follows Soleglad & Sissom (2001).

**Abbreviations**: RFA, personal collection of Richard F. Ayrey, Flagstaff, Arizona, USA; USNM, United States National Museum, Smithsonian Institution, Washington, DC, USA.

**Systematics**

Family Vaejovidae Thorell, 1876

Subfamily Vaejovinae Thorell, 1876

*Vaejovis elii* sp. n.

(Figures 1–13, Tables 1–2)

**Type locality and type depository.** USA, Arizona, Yavapai County, Mingus Mt., 34.70111°N 112.13939°W, 2,291 m a. s. l.; USNM.

**Type Material.** USA, Arizona, Yavapai County, Mingus Mt., 34.70111°N 112.13939°W, 2,291 m a. s. l., leg. R. F. Ayrey, 31 May 2019 1♀ (holotype, #RA2888), USNM, 1♂3♀♀ (paratypes, #RA2901, 2887, 2889, 2890), RFA, 31 August 2016, 3♂ (paratypes, #RA2442, 2885, 2886), RFA, 30 June 2012, 3♀♀ (paratypes, #RA756, 761), RFA.

The type specimens were found with a black light at night. The vegetation type is Ponderosa Pine Forest (Figs. 18–19). No other scorpion species were found syntopically.

**Etymology.** The species epithet is a patronym in honor of Eli Ayrey who found the holotype specimen and many of the other types.

**Diagnosis.** Small (holotype length 24.58 mm) scorpions. Color is dark brown, lighter on the legs, with underlying mottling on carapace and mesosoma (Fig. 1). Pedipalp movable finger with 7 ID denticles and fixed finger with 6, similar to most northern Arizona members of the “vorhiesi” group. Carapace of female is longer than the fifth metasomal...

Table 1: Morphometrics (mm) of Vaejovis elii sp. n.

**DESCRIPTION.** Based on holotype female, unless otherwise noted.

**Color.** Color is dark brown, lighter on the legs. Faint underlying motting on carapace and mesosoma.

**Carapace.** (Figs. 4, 6) Anterior margin of carapace moderately emarginated, posterior margin slightly emarginated. Carapace finely granular. Three lateral eyes on each side. Median furrow moderate and traverses entire length of carapace. Ratio of median eyes location from anterior edge/carapace length 0.33; carapace length/width at median eyes 1.44. Carapace of female is longer than metasomal segment V.

**Mesosoma.** Tergites finely granular with vestigial median carina on tergites I–VI. Tergite VII with vestigial carina on anterior third and strong dorsal lateral and lateral supramedian granular carinae on posterior half. Sternites III–VI finely granular and without carinae. Sternite VII with granular ventral lateral carinae on proximal 1/2, very weak to absent on posterior 1/5. Prestermites smooth. Spiracles ovoid with median side rotated 35 degrees from posterior sternite margin. Sternites with variable number of microsetae.

**Sternum.** (Figs. 5, 7). Sternum is Type 2.

**Genital Operculum.** (Fig. 5). Sclerites separated on posterior one-fifth.

**Pectines.** (Figs. 5, 7). Pectinal tooth counts 11/11 [2], 11/12 [1], 12/12 [n=6] and 13/12 [1] with a mean of 11.80 [n=20], SD 0.52 for females and 13/13 [1], 13/14 [2], and 14/13 [n=1], with a mean of 13.38 [n=8], standard deviation 0.52 for males. All pectinal teeth have extero-distal angling with large sensorial area. Middle lamellae 7/6. Fulcra are present. Each fulcra with 1–4 central setae.

**Telson.** (Fig. 12). Smooth with 4 pairs of large setae on the ventral surface, 3 large setae along both lateral edges of the vesicle and numerous smaller setae. Small, poorly developed subacicular tubercle present. Subacicular setae present at basal portion of subacicular tubercle. Small number of lateral acicular serrations (LAS) present; average of 5.25 (holotype and paratypes).

**Chelicerae.** (Fig. 13). Dorsal edge of movable cheliceral finger with two subdistal (sd) denticles. Ventral edge is smooth, with well-developed serrula on distal half. Fixed cheliceral finger...
with four denticles: basal, median, subdistal and distal. Basal and median denticles forked. Typical for genus.

**Pedipalps** (Fig. 20). Trichobothrial pattern type C (Vachon, 1974). Trichobothria *ib* and *it* at base of fixed finger. Pedipalp ratios: chela length/width 3.42; femur length/width 3.54; patella length/width 3.12; fixed finger length/carapace length 0.61.

**Chela.** Carinae moderate. Fixed finger median (MD) denticles aligned and divided into 6 subrows by 5 outer (OD) denticles and 6 inner (ID) denticles. Movable finger with 6 subrows, 5 OD denticles and 7 ID denticles (Soleglad & Sissom, 2001).

**Femur.** Carinae moderate.

Patella. Carinae strong, internal surface with very large granules on the DSPc carina.

Legs. (Fig. 9). Ventral surface of tarsomere II with single median row of spinules terminating distally with one spinule pair.

Hemispermatophore (Figs. 14–15). All descriptions based on left hemispermatophore. Wide hemispermatophore trunk. Lamellar hook sclerotized, strongly bifurcated at distal tip. Deep trough. Trough difference accounts for 85% of entire lamellar hook length. Weak distal crest is present on the inner distal aspect of the lamella, which is also barely visible from the ventral surface. Measurements (mm): trough difference, 0.60; lamellar hook length, 0.71; lamina length, 2.30; trunk width, 0.81; lamina width, 0.47; ratio of lamellar hook length to lamina length, 0.21; ratio of trough difference to lamellar hook length, 0.85.

Variability. Variability of male and female pectine counts found in most species of the “vorhiesi” group was also noted in *V. elii*. See the pectine section.

Reproduction. Several females were kept alive in captivity in order to observe them giving birth and to count the number of first instar juveniles (Fig. 16). Nine females gave birth. The juvenile counts were: 16, 18, 19, 20, 24, 24, 30, 31, and 31; mean = 23.67 (n=8), SD = 5.8524. Birth and postpartum behavior are as described in Ayrey (2013a).

Affinities. With the description of *Vaejovis elii* presented herein, 22 species are currently placed in the “vorhiesi” group of *Vaejovis* (see map, Fig. 21). Comparisons are made to *Vaejovis crumpi*, *Vaejovis grayae* and *Vaejovis trinityae*, the three species that are found nearest to Mingus Mountain, the locality of *Vaejovis elii* sp. n. It differs from all species compared by a combination of three important morphometric ratios: metasoma V L/W, femur L/W and chela L/W as well as the following. *V. crumpi* differs from *V. elii* sp. n. by six, *V. grayae* by seven, and *V. trinityae* by seven important morphometric characters (see Tab. 2).

Distribution. Known only from the type locality, Mingus Mountain, Yavapai County, Arizona, USA.

Additional Material Examined

In addition to type material listed below under new species description, the following specimens were examined (see Tab. 2).

*Vaejovis crumpi* Ayrey et Soleglad, 2011

*Vaejovis grayae* Ayrey, 2014
USA, Arizona, Yavapai Co., Chad, 14 June 2014, 3♂6♀ (USNM), 16 June 2012, 2♂2♀, leg. R. F. Ayrey & M. M. DeBoer-Ayrey (RFA).

*Vaejovis lapidicola* Stahnke, 1940
USA, Arizona, Coconino County, Red Sandstone Quarry, Flagstaff, 1 June 2011, 1♂7♀ (topotypes), leg. R. F. Ayrey & M. M. DeBoer-Ayrey (RFA).

*Vaejovis trinityae* Ayrey, 2013
Ayrey: *Vaejovis elii* sp. n.

Figure 21. Map of Arizona, extreme western New Mexico (USA) and northern Sonora (Mexico), showing the type locality of all 22 species of the *Vaejovis* "vorhiesi" group, including *Vaejovis elii* sp. n. Localities are divided into those of species exhibiting 7 inner denticles (ID) on the chelal movable finger (white rectangles with black lettering) and those with primarily 6 or 5 ID denticles (black rectangles with white lettering).

**Seven IDs:** 1 = *V. jonesi*, 2 = *V. lapidicola*, 3 = *V. paysonensis*, 4 = *V. crumpi*, 5 = *V. bigelowi*, 14 = *V. trinityae*, 17 = *V. grayae*, 22 = *V. elii* sp. n.

**Six or five IDs:** 6 = *V. vorhiesi*, 7 = *V. cashi*, 8 = *V. fetti*, 9 = *V. deboerae*, 10 = *V. electrum*, 11 = *V. tenuipalpus*, 12 = *V. halli*, 13 = *V. brysoni*, 15 = *V. bandido*, 16 = *V. grahami*, 18 = *V. troupi*, 19 = *V. islaserrano*, 20 = *V. patagonia*, 21 = *V. stetsoni*. 
Acknowledgments

I would like to thank my wife Melinda DeBoer-Ayrey for participating in three field trips to Mingus Mountain and Brandon Myers for his assistance with the hemispermatophore and mating plug. I would also like to thank the producers of ABC Nightline for coming to Mingus Mountain, with myself, to film the discovery of Vaejovis elii sp. n. for national television. The video from the ABC Nightline television program can be found via the link in this paper. I also thank two anonymous reviewers for their help and comments.
