EDITOR: Victor Fet, Marshall University, ‘fet@marshall.edu’

ASSOCIATE EDITOR: Michael E. Soleglad, ‘msoleglad@gmail.com’

TECHNICAL EDITOR: František Kovařík, ‘kovarik.scorpio@gmail.com’

Euscorpius is the first research publication completely devoted to scorpions (Arachnida: Scorpiones). *Euscorpius* takes advantage of the rapidly evolving medium of quick online publication, at the same time maintaining high research standards for the burgeoning field of scorpion science (scorpiology). *Euscorpius* is an expedient and viable medium for the publication of serious papers in scorpiology, including (but not limited to): systematics, evolution, ecology, biogeography, and general biology of scorpions. Review papers, descriptions of new taxa, faunistic surveys, lists of museum collections, and book reviews are welcome.

Derivatio Nominis

The name ***Euscorpius*** Thorell, 1876 refers to the most common genus of scorpions in the Mediterranean region and southern Europe (family Euscorpiidae).

Euscorpius is located at: <https://mds.marshall.edu/euscorpius/>

Archive of issues 1-270 see also at: <http://www.science.marshall.edu/fet/Euscorpius>

(Marshall University, Huntington, West Virginia 25755-2510, USA)

ICZN COMPLIANCE OF ELECTRONIC PUBLICATIONS:

Electronic (“e-only”) publications are fully compliant with ICZN ([International Code of Zoological Nomenclature](#)) (i.e. for the purposes of new names and new nomenclatural acts) when properly archived and registered. All *Euscorpius* issues starting from No. 156 (2013) are archived in two electronic archives:

- **Biotaxa**, <http://biotaxa.org/Euscorpius> (ICZN-approved and ZooBank-enabled)
- **Marshall Digital Scholar**, <http://mds.marshall.edu/euscorpius/>. (This website also archives all *Euscorpius* issues previously published on CD-ROMs.)

Between 2000 and 2013, ICZN **did not accept online texts** as “published work” (Article 9.8). At this time, *Euscorpius* was produced in two **identical** versions: online (ISSN 1536-9307) and CD-ROM (ISSN 1536-9293) (laser disk) in archive-quality, read-only format. Both versions had the identical date of publication, as well as identical page and figure numbers. **Only copies distributed on a CD-ROM** from *Euscorpius* in 2001-2012 represent published work in compliance with the ICZN, i.e. for the purposes of new names and new nomenclatural acts.

In September 2012, ICZN Article 8. What constitutes published work, has been amended and allowed for electronic publications, disallowing publication on optical discs. From January 2013, *Euscorpius* discontinued CD-ROM production; only online electronic version (ISSN 1536-9307) is published. For further details on the new ICZN amendment, see <http://www.pensoft.net/journals/zookeys/article/3944/>.

Publication date: 21 May 2022

Summary

The scientific (Latin) names of scorpion species are widely used across the world by both experts and amateurs. However, in China, there is a great need for designating standardized Chinese names for various scorpions since it is difficult for those not familiar with Latin alphabet to memorize the scientific names. Currently used Chinese names often cause confusion and misunderstanding due to a lack of standardized, unified naming. The present work critically revises the existing formal Chinese scorpion names, vernacular names (used by local population and amateurs), and the names used in Chinese scientific publications, along with the confusion they have caused. A general review of the etymology and types of scientific names in scorpions is also provided. A standardized rule for translating scientific names into Chinese names (exclusively for the Order Scorpiones) is established for the first time. A list of all the scientific names of the valid extant scorpion species is given, translated into Chinese along with the Latin names.

Introduction

The Swedish botanist, zoologist, taxonomist and physician, Carl von Linné (1707 – 1778; also known as Carl Linnaeus) was the one who formalized the binomial nomenclature, the foundation of the system of scientific classification. Linnaeus's major contribution to taxonomy was the establishment of universally accepted conventions for the naming of organisms which marked the starting point of consistent use of binomial nomenclature (Reveal & Pringle, 1993).

The binomial nomenclature (literally meaning “two-name system”) is a formal system of naming living organisms. The name comprises two parts, both of which are in Latin grammatical forms, although they can originate from other languages (see below). Such a name is the only true scientific name, or more informally it is also called as a Latin name. Latin is used for scientific names for one main reason, as it is a dead language, used by no people or nation as an official language, thus it does not change over time.

In modern biology, the application of Latin in scientific names is ruled by internationally agreed codes of rules, of which the two most important are the International Code of Zoological Nomenclature (ICZN) for animals and the International Code of Nomenclature for algae, fungi, and plants (ICNafp). Although the general principles of binomial nomenclature are similar between these two codes, there are some differences, and the present study only focuses on animal naming.

The first part of a binomial Latin name is the genus name, or generic epithet. It stands for the genus to which the species belongs. It must be in the form of a noun or a substantivised adjective treated as a noun (James, 2010).

The second part is the specific name, or specific epithet, which distinguishes the species within the genus (congeneric species). Only in combination with a generic name does it have any validity or make any sense, but it can be used in more than one genus. Neither generic nor specific names need to be descriptive, accurate or relevant, and they cannot be rejected merely for being erroneous in these respects, although some earlier authors sought to do so (James, 2010). For example, in scorpions, *Somalicharmus* Kovařík, 1998 is a geographically erroneous name since the only species of this genus is actually found in Ethiopia rather than Somalia. The name *Srilankametrus indus* (DeGeer, 1778) is also misleading as the species only occurs in Sri Lanka but not India. These Latin names cannot be changed due to the ICZN principles of priority and stability. Nevertheless, it still could be useful to provide an explanation to a non-specialist when using such names.

The first letter of the generic epithet must be capitalized, while that of the specific epithet is not, even if it is a name of a person or a place. Additionally, both parts of a binomen are italicized. If a complete scientific name has been mentioned earlier in the text, the generic epithet can then be abbreviated into the first letter with a period. For example, *Androctonus bicolor* can be abbreviated as *A. bicolor* if the whole name was referred to previously. If a lower rank (subspecies) is accepted for one species, there will be a third part denoting the subspecific epithet. Similar to the binomen, the name of a subspecies is called as “trinomen” or “triple name”. The subspecific epithet is also italicized without capitalized letter. If there is a subsequently named subspecies, then the original species becomes an “aggregation” of two subspecies, the type subspecies (or nominate subspecies) and the subsequently

Figures 1–2. **Figure 1.** A group of *Olivierus martensi* (Karsch, 1879), the most common scorpion in China, *in vivo* habitus. **Figure 2.** Three representative specimens of *O. martensi*. Adult male (2a), adult female (2b), pallid immature (2c).

named subspecies. The type subspecies is synonymous with the original species (before the other subspecies is found), and the subspecific epithet is the same as the specific epithet.

The main body (binomen) of a scientific name is followed by the name of the author and the year of publication, separated by a comma and not italicized (e.g., *Androctonus afghanus* Lourenço & Qi, 2006). If the species was originally described in another genus, the author's name and the year will be enclosed in parentheses (e.g., *Androctonus australis* (Linnaeus, 1758) was originally described as *Scorpio australis* Linnaeus, 1758, a name addressed as the *protonym*).

There are cases for amending the status of scientific names. An animal name is regarded as a *homonym* if there are two identical names within the Kingdom Animalia. According to the ICZN, such name is not accepted and has to be changed according to priority of the name described earlier. For instance, the scorpion genus *Orthochirus* Karsch, 1892 was originally described as *Orthodactylus* Karsch, 1881, a name, which already existed in Sauropsida as *Orthodactylus* Hitchcock, 1858. In a case of *synonymy*, the same taxon might have several available names but the senior synonym must be used as valid: thus, *Orthodactylus*, a fossil crocodile, is now a junior synonym of *Batrachopus* Hitchcock, 1845. One should consult ICZN for much more details on homonymy, synonymy, availability, validity, etc.

All the scientific names, regardless of their etymology, are grammatically treated as Latin. Most are derived from Latin and its successors or from ancient Greek (James, 2010). Latin nouns are declined, and verbs are conjugated, that is, their endings change according to their case, tense, person and number, or, more simply, the manner in which they are used (James, 2010). Adjectival specific epithet must agree with their genus in gender. If a species is transferred from a genus that has a masculine name to a feminine one (or vice versa), the ending of the specific epithet must be altered accordingly. If a specific epithet, which appears to be an adjective, is in fact a noun in apposition, their endings do not change to agree with the gender of the generic epithet. There are three common Latin endings: (i) -us (masculine), -a (feminine), -um (neuter); (ii) -is (masculine), -is (feminine), -e (neuter); (iii) -er (masculine), -era (feminine), -erum (neuter).

Types of animal names used in China

Just like names of people, animal names in local languages can be rather diverse if those animals are well-known among different cultures or groups of people. There are usually five types of names for animals in China:

(a) a native/folk name (indigenous to a certain country or even a region, it may have a long history but is not based on scientific studies);

(b) a vernacular/common name (used only by the amateurs, coined by someone who has a better knowledge of the animal group than those using a native/folk name; such names are usually created and used among animal breeders, keepers and traders);

(c) a Chinese translation of a scientific Latin name (the translation can be literal, free or transliterated);

(d) a Chinese translation of a foreign native/common name (usually from English);

(e) the “formal Chinese name (中文正名)” (established by the Chinese researchers in certain fields and used in their science publications).

Moreover, there is a concept of “Chinese scientific name (中文学名)” in China. However, as stated before, the only scientific name for an animal is its Linnean name (Latin or at least Latinized), so if one replaces the term “scientific name (学名)” with “Latin name”, the outcome will be as weird as “Chinese Latin name”. How can a name be both Chinese and Latin at the same time? Such concept is clearly contradictory and misleading. The “Chinese scientific name” is a name that seems somewhat academic, but one species may still have multiple “Chinese scientific names” and not all of them are applied in the Chinese science publications. Nevertheless, so-called “Chinese scientific names” are used more or less equally with formal Chinese names, and the term “Chinese academic names (中文学术名)” can best replace it. A formal Chinese name, however, is the most chaotic category. It can come from any of abovelist categories (a, b, c, or d). As a result, formal Chinese names are not “academic” at all since they also include native/common names. Besides, the “self-created name” is the most ubiquitous among formal Chinese names coined by researchers which have no origin at all, and are certainly irrelevant to the etymology of scientific Latin names. Such self-created name is highly restricted by the knowledge of a certain group if coined according to the morphology. There is a high possibility that a self-created name can have the etymological meaning of another existing taxon (which leads to conflict), or fails to summarize unique characters of its taxon (which makes it meaningless). A Latin name, if it is a morphonym, does not have to be fully descriptive since naming is limited by knowledge of this taxon. However, in the case of Chinese names, there is no such an excuse as there exist all the available contributions, much more adequate than what the original author had. If one really craves for renaming a taxon in Chinese, the new name should be superior to the existing one (at least in its meaning). Most of the self-created names in the formal Chinese names among the taxa that I had studied fail to achieve this, making the action of renaming rather meaningless. Those who coin them are reluctant to translate scientific Latin names — either because of finding it rather difficult or due to ill-conceived “cultural confidence”.

As a result, an apparently academic (to a non-scientist) formal Chinese name is not academic at all. Origins of these names are extremely diverse and chaotic due to the fact that no formally recognized Chinese nomenclature exists (unlike the scientific Latin names), thus causing lots of confusion and conflicts. The formal Chinese names of scorpions are poorly constructed.

The present contribution critically revises the current formal Chinese names of scorpions used in the Chinese scientific publications (as well as the folk and vernacular

Figure 3. The only academic scorpion book in China, *Scorpion Biology and Toxins*.

names). An improved principle of translation of Latin names and a list of all valid names of extant scorpion taxa are offered. Also, the most comprehensive study of the etymology of scorpion names is presented.

Folk names applied to scorpions in China: a history

About 2000 years ago, the first dictionary in China, *Er Ya* (尔雅, in Chinese) or *Literary Expositor*, had already made a rough record of scorpions (Li, 2016). During the Spring and Autumn period (770–476 BC), *The Book of Songs* (诗经, in Chinese) recorded the occurrence of scorpions as well, leading people to realize that this creature can be used as a medicine. The book *Shu Bencao* (蜀本草, in Chinese), during the Later Shu Dynasty, formally treated scorpions as medicine. In the Song Dynasty, the book *Kaibao Bencao* (开宝本草, in Chinese) initiated to use the word “蝎子” (simplified as “蝎”, a Chinese equivalence of “a scorpion”). The *Compendium of Materia Medica* written by Shizhen Li (李时珍, in Chinese) during the Ming Dynasty provided a very detailed description of scorpion, such as morphology, usability, processing method and prophylaxis and treatment for scorpion sting, for the first time. Additionally, *Shennong's Classic of Materia Medica*

(神农本草经, in Chinese) during the Eastern Han Dynasty, *Bencao Tujing* (本草图经, in Chinese) or *Illustrated Classics of Materia Medica* during the Song Dynasty, *Bencao Beiyao* (本草备要, in Chinese) or *Essentials of Materia Medica* in 1694 and *Bencao Zhengyi* (本草正义, in Chinese) during the Qing Dynasty also described the medical usage of scorpions. The most widely distributed scorpion species in China is *Olivierius martensi* (Karsch, 1879) (Figs 1–2; originally described in the genus *Buthus* Leach, 1815 by the German arachnologist Ferdinand Karsch and then assigned to *Mesobuthus* Vachon, 1950 for a long time). This species has been used as traditional Chinese medicine for more than a thousand years (and even today) to treat several diseases such as rheumatoid arthritis, apoplexy, epilepsy and chronic pain. As a result, it is given a large variety of names.

The most commonly used and famous name is “钳蝎 (qián xiē)” (“pincer scorpion”) reflecting its obvious pedipalps. The same name “钳蝎” is currently the formal Chinese name for the family *Buthidae* C. L. Koch, 1837 (see below). *O. martensi* alone, however, may also be called “东亚钳蝎 (dōng yà qián xiē)” (“East Asian pincer scorpion”). In Chinese scientific publications, this species is also referred to as “马氏钳蝎 (mǎ shì qián xiē)” (“Martens's pincer scorpion”) when it is considered as *Buthus martensi* and as “

马氏正钳蝎 (*mǎ shì zhèng qián xiē*) ("Martens's true pincer scorpion") when it is considered as *Mesobuthus martensii*. "东亚钳蝎" may also be related with another folk name, "远东蝎 (*yuǎn dōng xiē*)" (the "Far East scorpion").

Besides the name "钳蝎", another most used name is "全蝎 (*quán xiē*)" ("complete scorpion") or "全虫 (*quán chóng*)" ("integral bug") in Chinese medicine. It is also called "蒙山全蝎 (*méng shān quán xiē*)", "沂蒙全蝎 (*yí méng quán xiē*)" or "沂蒙山全蝎 (*yí méng shān quán xiē*)" since it is said (incorrectly, of course) that the scorpions in Mengshan ("蒙山 (*méng shān*)"), Linyi City (临沂市), Shandong Province differ from those in other regions by having two pedipalps and eight legs whereas others only possess six legs, which is the reason for the name "integral scorpion" (having a total of ten appendages). Additionally, names like "会蝎 (*huì xiē*)" or "会全蝎 (*huì quán xiē*)" may be miswritings of "全蝎". Alternative names include "东全蝎 (*dōng quán xiē*)" ("Eastern complete scorpion"), "咸全蝎 (*xían quán xiē*)" (the "salty complete scorpion"), "盐水蝎 (*yán shuǐ xiē*)" ("saltwater scorpion") , "淡全蝎 (*dàn quán xiē*)" ("tasteless complete scorpion") and "淡全虫 (*dàn quán chóng*)" ("tasteless complete bug") for unknown reasons.

Three names may be associated with the morphology, i.e., "链蝎 (*liàn xiē*)" ("chain scorpion"), "荆蝎 (*jīng xiē*)" ("thorny scorpion") and "剑蝎 (*jiàn xiē*)" ("sword scorpion"). Other names do not end with the word "蝎". "琵琶虫 (*pípa chóng*)" is also a morphonym and it may result from the description of scorpion's body by the Chinese as they consider it is similar to the shape of pipa ("琵琶", a traditional Chinese musical instrument). The name "茯背虫 (*fú bèi chóng*)" comes from the Chinese medicine "茯苓 (*fú líng*)" (refers to the mushroom *Wolfiporia extensa* (Peck) Giims (1984)) which, according to the Chinese dictionary, exhibits a light-black or puce-colored surface. As a result, it can be freely translated as "brownish back bug".

The word "虿 (*chài*)" is a general word for the venomous creatures like scorpions, wasps and snakes and there might be no English equivalent. "虿尾虫 (*chài wěi chóng*)" is a name used exclusively for the scorpions (as well as the word "蟻祁 (*yǐ qí*)"). It cannot be directly translated into English as well, but "a bug with a poisonous tail" will be the closest interpretation.

The final two names are connected with specific historical characters. "杜伯 (*dù bó*)" is given after a homonymous minister of the emperor Xuan Wang in the Zhou Dynasty. This person had curly hair that resembled "虿" (probably referring to a scorpion metasoma) according to *Festal Songs-Durenshi* (小雅·都人士) within *The Book of Songs*. "主薄虫 (*zhǔ bù chóng*)" is named after an ancient official title "主薄 (*zhǔ bù*)" (similar to the registrar, in modern sense). Several ancient books (e.g., the *YaoYang Essays-Chapter Insecta* (酉阳杂俎·虫篇), the *Supplement of National History of the Tang Dynasty* (唐国史补) and the *Biography of the Tang Dynasty* (大唐传载)) provide an analogous explanation: once upon a time, there was a registrar who accidentally introduced scorpions to Jiangnan ("江南", in some literature as Jiannan "

剑南"); these are two different places), in which the scorpions were never recorded before.

The other two species that may sometimes be found in Chinese medicine are *Lychas mucronatus* (Fabricius, 1798) (common in the Southwest) and *Mesobuthus thersites* (C. L. Koch, 1839) (common in the Northwest), but they have no folk names.

Scorpions are fortunate to have a single, exclusive Chinese name "蝎" representing all the members of the Order Scorpiones. Similar cases are, for example, "蜘蛛" or "蛛" for spiders and "蜈蚣" or "蚣" for centipedes. However, many other taxa are not lucky to have exclusive names. For instance, the members of Solifugae are usually termed as "避日蛛" ("sun-avoiding spider", and many other names such as "风蝎 (wind scorpion)" or "骆驼蜘蛛 (camel spider)" directly translated from English common names; at least this name is partially from the etymology of Latin name) yet they are not true spiders. Members of Thelyphonida (Uropygi sensu stricto) and Amblypygi are termed "鞭蝎" and "鞭蛛" according to their English common names, "whip scorpion" and "whip spider", respectively. These names can easily mislead the public to believe that they are either scorpions or spiders. Similar cases are seen in vertebrates, namely, geckos, which are usually termed as "壁虎" ("wall tiger"), and their Chinese names often end with "虎", which is the name used exclusively for tigers. Many other taxa of Arachnida also do not have a single-word Chinese name, such as Palpigradi and Schizomida. Some names do not conflict with a large group (on the order level), but they still do make conflicts if a smaller group (on the generic level) is translated. For example, Opiliones in China are usually termed as "盲蛛" ("blind spider") (which should better be translated as "牧羊蛛" or "牧蛛" ("shepherd spider", a translated name that has occurred in Chinese literature but was not accepted as a formal name) if no exclusive name is given). However, it is not a spider; at the same time, one generic name in the Araneae, *Nops* MacLeay, 1839, can be literally translated and deserves the name "盲蛛" ("blind spider"). On the other hand, although some taxa do have a single exclusive word that represents them (for example, "螱" for termites and "𧇵" for millipedes), their current Chinese names still are either confusing (e.g. "白蚁" ("white ant") for termites, which are not ants) or obscure (e.g. "马陆", two words that are directly translated as "horse" and "land") for millipedes, which cannot be transliterated). Despite that this is not so relevant with the current study (as scorpion names do not have such problems, though the names of other taxa may be mistaken for scorpions), I believe it is essential to establish and designate exclusive names for those taxa, which do not have one, in order to reduce confusion and increase simplicity (one word for a taxon is always better than two).

Current confusion in Chinese scorpion names

There are generally three categories of Chinese names for scorpions: the folk names, the vernacular names used by amateurs (including keepers, breeders and

traders), and the formal Chinese names. Aside from the folk names, which has been discussed in detail above, the other two types of names are most commonly used, and, at the same time, exhibit the highest degree of confusion. Vernacular names used by players and traders are rather confusing and arbitrary. Most of these names are a combination of a name of a locality (where the species may be either found or not), a characteristic of the scorpion and sometimes a folk/vernacular “generic name”. The most often seen names are borrowed from English common names (as well as in other taxa; the formal Chinese name will take those as the so-called “formal names” as well). The name of the locality applied in the vernacular name can be erroneous; it usually reflects the species’ range (but rarely the type locality). Below, I list several examples currently found among the vernacular names.

Vernacular Chinese names for the species of the genus *Uroplectes* Peters, 1861 all begin with “Namibian”; however, not all its species occur in this country (e.g., “纳米比亚蓝宝石蝎” (the “Namibian sapphire scorpion”, in English; the following Chinese vernacular names will all be directly translated into English) is the Chinese vernacular name of the species *U. flavoviridis* Peters, 1861 which only occurs in Mozambique, Republic of Malawi, Zambia, Tanzania, Zimbabwe and Republic of South Africa). The vernacular name of *Hottentotta tamulus sindicus* (Pocock, 1900) and *H. t. gangeticus* (Pocock, 1900) (both now synonymized with *H. tamulus* (Fabricius, 1798)) are “Indian crocodile-backed scorpion” and “Pakistan crocodile-backed scorpion”, respectively. However, the subspecific epithet of the former is derived from a province in Pakistan (Sind) while that of the latter, from the Gange, a river which does not flow through Pakistan. Similarly, the naming by the locality can be rather arbitrary. For instance, the species *Androctonus crassicauda* (Olivier, 1807) is named “Turkish black fat-tailed scorpion” and it has no subspecies (the previous subspecies was returned back to the species rank as *A. gonneti* Vachon, 1948). However, some Chinese traders fabricated a subspecies name, “*Androctonus crassicauda israe*” (since it is not a valid name I will not italicize it), without even correctly turning the locality name (Israel) into Latinized “*israelis*”. They gave it another name “Israeli black fat-tailed scorpion”. Turkey is not the type locality of this species (type locality: Persia (now Iran), Esfahan Province, Kashan) and both Turkey and Israel were just two countries of the previously recognized distribution (a recent study showed that the Turkish populations may refer to another species in the south, *A. turkiensis* Yağmur, 2021, at least for the Şanlıurfa Province; the true *A. crassicauda* is restricted to the Iranian Plateau (E.A. Yağmur, pers. comm.). It will be relatively reasonable if a vernacular name of this species was limited to “black fat-tailed scorpion” adding Turkey or Israel as geographic modifiers when sources of scorpions that are sold in China are known (nevertheless, no specimens sold in China and labeled as “Turkish black fat-tailed scorpion” originate from Turkey, and at the same time, specimens from the Mardin Province of Turkey are called a

“Syrian brown fat-tailed scorpion”). Likewise, *Androctonus cf. crassicauda* (labeled so by the foreign sellers) is named an “Oman brown fat-tailed scorpion” by the Chinese traders. It is obvious from the abbreviation *cf.* (from Latin word *conferre*, meaning “compare” or “confer”) that the foreign sellers are not sure of the identity of the species yet they thought it was most close to the species *A. crassicauda*. However, the Chinese vernacular name does not indicate such meaning.

The “Israeli golden scorpion” name assigned for *Leiurus quinquestriatus* (Ehrenberg, 1828) in China (for *Scorpio palmatus* (Ehrenberg, 1828) in other countries) is one of the most misleading common names. Those Chinese users distinguish three different “species” as *L. quinquestriatus*, *L. quinquestriatus quinquestriatus* and *L. quinquestriatus hebraeus* (wrongly identified, with the true identity being *Leiurus haenggii* Lowe, Yagmur & Kovařík, 2014; this subspecies was elevated to species in 2014 as *L. hebraeus* (Birula, 1908)). This clearly shows the lack of knowledge of trinominal nomenclature. They define the type subspecies as “the golden-back subspecies” and *L. q. hebraeus* as “the black-back subspecies”. The premodifier “Israeli” is only one of the known countries (Israel) of distribution for *L. q. hebraeus*, but never for the type subspecies. As a result, logically, this premodifier can only apply to the second subspecies, but not the type subspecies or the species (since those Chinese users consider them separately).

Furthermore, *Leiurus nasheri* Kovařík, 2007 is named a “Yemen golden scorpion”. However, it has already found to be a junior synonym of *L. brachycentrus* (Ehrenberg, 1829) and the true identity of the scorpions they sell is *Leiurus arabicus* Lowe, Yagmur & Kovařík, 2014, which differs greatly from the former and does not occur in Yemen.

The names based on the characteristics can also be unrepresentative. For example, the vernacular name of the genus *Opistophthalmus* C. L. Koch, 1837 is “yellow claw scorpion” which only stands for several yellow-colored species while dark species of *Opistophthalmus* without yellow claws do exist. *O. glabrigerfons* Peters, 1861 and *O. wahlbergi* Thorell, 1876 were both given the name “African yellow claw scorpion”, although the latter never appeared in the market. Additionally, the name “yellow claw scorpion” is also referred to a completely unrelated but yellow species, *Bothriurus coriaceus* Pocock, 1893, combined with the geographic modifier “Chilean”. This is a typical group of examples that indicates the ignorance of the generic sense (i.e., people do not limit a certain name to a certain taxon). *Opistophthalmus boehmi* (Kraepelin, 1896) was given the name “South African tricolor scorpion”, while *Chelocionus jonesii* Pocock, 1892 was named as “tricolor earth-digging scorpion”. *Parabuthus granulatus* (Ehrenberg, 1831) is a polymorphic species with color forms of brownish black, bicolor (dark body with light legs), light brown, brownish red and yellow. However, its vernacular name is a “red thick-tailed scorpion” while red is the rarest color form and has never appeared on the Chinese market. Likewise, *P. capensis* (Ehrenberg, 1831) and *P. mossambicensis* (Peters, 1861) are named a “golden back

“thick-tailed scorpion” and “yellow thick-tailed scorpion”, respectively. Yet both of the species are usually orange yellow (exceptions are when the former may be greenish yellow or pitch black and the latter may be light yellow).

Similarly, the name “flat rock scorpion” is referred both to the genus *Hadogenes* Kraepelin, 1894 and a species, *Scorpiops validus* (Di, Cao, Wu & Li, 2010) (combined with the geographic modifier “Yunnan” or “Vietnam”, the latter is not in the range of the species). Both the genus *Cheloctonus* Pocock, 1892 and *Opisthacanthus* Peters, 1861 are called “earth-digging scorpion”. Both the species *Buthus occitanus* (Amoreux, 1789) and *Aegaeobuthus gibbosus* (Brullé, 1832) are called “Mediterranean yellow scorpion” or “Greek golden scorpion”. Both the species *Lychas mucronatus* and *Isometrus maculatus* (DeGeer, 1778) are called a “Hainan double-stinger scorpion”. Both the species *Tityus serrulatus* Lutz & Mello, 1922 (or *T. carilloi* Ojanguren Affilastro, 2021, a new species which used to represent the Argentinian population of the former) and *Odontobuthus odonturus* (Pocock, 1897) are called a “man killer scorpion”, with the geographic modifier “Brazilian” and “Iranian”, respectively. All the Tibetan black species within the genus *Scorpiops* Peters, 1861 are termed as a “Tibetan scorpion” without modifiers for distinction. Similarly, the name “golden scorpion” is used in some species across several genera: *Androctonus* Ehrenberg, 1828, *Buthus*, *Chihuahuanus* González-Santillan & Prendini, 2013, *Hadrurus* Thorell, 1876, *Heteroctenus* Pocock, 1893, *Javanimetrus* Couzijn, 1981, *Leiurus* Ehrenberg, 1828, *Mesobuthus*, *Olivierius* Farzanpay, 1987, *Parabuthus* Pocock, 1890, *Scorpio* Linnaeus, 1758, *Smeringurus* Haradon, 1983 and *Uroplectes*. For example, *Hadrurus arizonensis* Ewing, 1928 was given the name “Arizona desert golden scorpion” and its *pallidus* color morph (as a subspecies) was named as “Florida desert golden scorpion” (an erroneous locality!). However, the name “California desert golden scorpion” assigned for *Smeringurus mesaensis* (Stahnke, 1957) led many people to believe that those species are closely related.

In a more complicated case, the name “fat-tailed scorpion” is used for both the genus *Androctonus* (except for *A. amoreuxi* (Audouin, 1826)) and the species *Mesobuthus thersites* (as *M. mongolicus*, see Kovařík et al. (2022)) with a geographic modifier “Pakistan”, an erroneous distribution of the species), leading many newcomers to believe the latter was a species of the former. Additionally, the *Androctonus baluchicus* (Pocock, 1900) is named a “Pakistan black fat-tailed scorpion” which further confuses its relationship with the species *M. thersites*. *A. amoreuxi* is named a “Libyan golden scorpion” while the source of the specimens is actually Morocco. Moreover, the name “fat-tailed scorpion” is often confused with the name “thick-tailed scorpion” which usually refers to the genus *Parabuthus*. As a result, names like “fat thick tail scorpion” appeared. Furthermore, in the genus *Parabuthus*, the vernacular names of two species (*P. pallidus* Pocock, 1895 and *P. maximus* Werner, 1913 (wrongly identified as *P. liosoma* (Ehrenberg, 1828))) were ended with “thick tail golden scorpion”, arousing the confusion of their

assignations to the “vernacular genera” “golden scorpion” or “thick-tailed scorpion”. The name “fat-tailed scorpion”, combined with an adjective modifier “black”, referred to either a certain species in the genus *Androctonus* (e.g., *A. bicolor* and *A. mauritanicus* (Pocock, 1902)) or all the black species within it. The name “black thick-tailed scorpion” refers to a single species, *Parabuthus transvaalicus* Purcell, 1899. The distinctions between *A. mauritanicus* and *P. transvaalicus* are actually rather obvious, yet such similar vernacular names have “pre-inculcated” a sense of similarity which obstructed the beginners’ judgement. Finally, the species *P. pallidus* is also called an “albino black thick-tailed scorpion”. However, it is not a color form of *P. transvaalicus* and these two species are not phylogenetically close.

By the same token, the name “rainforest scorpion” refers to both the species *Heterometrus silenus* (Simon, 1884) and its genus. The name “emperor scorpion” refers to both the species *Pandinus imperator* and its genus. These names are not specifically confined and lead to the confusion when a “diagnostic key” is proposed by some Chinese amateurs. They define a “rainforest scorpion” as a scorpion with black telson and smooth chela and an “emperor scorpion” a scorpion with red telson and rough chela. These characteristics are actually only valid for the specific species, *H. silenus* and *P. imperator*. However, since these two vernacular names can also refer to the two genera, some beginners may consider it as a “generic key”, which further aroused confusions when they saw *Heterometrus* species with a red telson and rough chela (e.g., *Chersonesometrus fulvipes* (C.L. Koch, 1837), previously in the genus *Heterometrus*), wondering why it is not assigned to *Pandinus*. The vernacular name of *H. longimanus* (Herbst, 1800) is a “long-clawed rainforest scorpion”. This vernacular name is partially reasonable as the specific epithet is a combination of *longus* (long) and *manus* (hand). However, another species that appeared later in the Chinese pet trade, *H. thorelli* (Pocock, 1892) is also called a “long-clawed rainforest scorpion”, and sometimes as “Thorell’s long-clawed rainforest scorpion”. As a result, many beginners refer to the latter as the “long-clawed rainforest scorpion”, which overrides the legitimacy and priority of the vernacular name for *H. longimanus*.

Finally, just like for the so-called “*Androctonus crassicauda israei*” case mentioned above, many traders fabricated a subspecific name for *A. australis* from Tunisia, “*Androctonus australis tunisia*” (or sometimes “tunisien”). There has never been such a subspecies, yet many amateurs firmly believe it to be a valid name. The confirmed distribution of *A. australis* in Africa includes Algeria, Chad, Egypt, Libya, Mali, Morocco, Niger, Sudan and Tunisia. Tunisia is actually the region with the most abundant occurrence of this species in Africa. Many *A. australis* sold on pet market are from this country, so this fabricated “subspecific name” is not meaningful if no precise locality is provided. Additionally, several Chinese vernacular names were used for the species *A. australis* and its former subspecies. *A. australis* was named an “Egyptian yellow fat-tailed scorpion” (or simply “yellow fat-tailed scorpion”), *A.*

australis hector a “Hector yellow fat-tailed scorpion”, *A. australis libycus* “Libyan yellow fat-tailed scorpion” and the fabricated name “*Androctonus australis tunisia*” as “Tunisian yellow fat-tailed scorpion”. Later, when the existence of the nominotypic subspecies, *A. australis australis*, was realized by the traders, they treated it as a taxon independent from *A. australis*. This created further confusion. Nominotypic subspecies indeed has a separate range and identity but often it appears in literature by default, “automatically”, when any other subspecies is described. Its type specimen and locality are the same as in the species. At any rate, all the subspecies of *A. australis* were synonymized in 2009 by A. Ben Othmen et al., currently leaving no subspecies valid.

Breene et al. (2003) updated a list of English common names of arachnids and the code for designating common names, mostly for the common species distributed in United States and Canada, as well as several globally well-known taxa. They stated in the introduction that common names had been demonstrated as more stable than scientific names since the latter may change due to priority, improper use of Latin, misidentification (including taxonomic changes), and many other reasons. However, the most prominent problem of many common names is that one name can be used for multiple taxa and one taxon could have multiple names that are used contemporaneously (they will not be replaced in case of junior synonyms in scientific names). For scorpions only, their list failed to list many other common names for one species (which will falsify the superiority of the common names) and some names are not exclusively for one species. For instance, the English common name for the species *Androctonus australis* was given as “fattail scorpion”. However, this species also has names like “yellow fat-tailed scorpion”, “Egyptian fat-tailed scorpion” and “Sahara scorpion”. On the other hand, the name “fattail scorpion” alone (without any premodifier) is also used for the genus *Androctonus* (the entire genus or some species), genus *Parabuthus* (the entire genus or some species), genus *Hottentotta* (some species), genus *Lychas* (some species), *Orthochirus scrobiculosus negebensis*, and even family Buthidae. Similarly, the name “Asian forest scorpion” was used only for *Heterometrus longimanus* by Breene et al. (2003), but this name (sometimes with a middle modifier such as “giant” or “blue”) actually refers to many other congeneric species (e.g. *H. spinifer*, *H. silenus* (formerly misidentified as *H. petersii*), *H. laoticus* and *H. cyaneus* (now *Javanimetrus cyaneus*) and even the genus itself. Although a regulation for designating common names is provided in their paper, there seems to be no specific reason for each name and those names may just have been selected from several well-known common names. Their intention of setting a regulation for the common names is exemplary, although it will be rather difficult (and even minimally effective since the common names are subjective and arbitrary) to formally establish a list with each species having its exclusive name. Their regulation is not so informative for the present study since their nomenclature is not simply based on the etymology of the taxon, not to mention that an English translation of the

Latin name can simply be much longer than the original one (and would often sound weird).

In China, a non-English speaking country, the formal Chinese names are given to the animal species that are involved in research for the convenience of the daily communication and public cognition. This formal Chinese name somewhat resembles the English common names *sensu* Breene et al. (2003) in the sense of purpose. Nevertheless, the nomenclature is as well far from standardization. These formal Chinese names can be subdivided into several types: (a) the translated names of Latin names (usually including: literal translation, free translation and transliteration, often wrongly or incompletely translated), (b) the translated names of English common names, (c) the Chinese folk names, (d) the vernacular names used in pet trades and among amateurs, and (e) the self-created names for certain taxa that have nothing to do with the original meanings of the Latin names. These different approaches lead to a chaotic condition which often causes misunderstandings or conflicts. This current situation may result from the neglect of the global-scale taxonomy and the lack of the sense of overall view. These names usually occur in the Chinese scientific publications and college students’ thesis which influence the self-learning of amateurs. The following examples will keep the original Chinese names.

The folk names for certain species are relatively scarce in China, since almost only one species is the best known, i.e., *O. martensii*; yet one is applied in the formal Chinese name for the genus *Buthus*, which is the “钳蝎”, as mentioned above. But this genus currently is only known from Middle East, Africa, and Southern Europe (Sousa et al., 2017). This genus has never been recorded from China; nevertheless, it is given a Chinese name. The reason could be the old classification, as *O. martensii* was originally described in the genus *Buthus*. Thus, the name may simply come from the appellation by the civilians who would easily spot this species in rural areas. However, there are people wondering why it is named as the “pincer scorpion”, as all the scorpions have a pair of pedipalps and there is nothing special in either the morphology or the function of the pincers of the genus *Buthus*. Since the reason to call this genus as “钳蝎” is irrational and it is not endemic to China (a fact that would eliminate the excuse of “for a cultural and historical sense”; i.e., some people hold on to the opinion that if a species holds a traditional name for hundreds or thousands of years, this name can be reckoned as its formal Chinese name), the name should be altered (see below).

In the Chinese publication “中国宠物商店出售的2种越南异蝎” by Mingsheng Zhu (朱明生) and Xiaofeng Yang (杨啸风) (2007) (the paper, which published the species *Heterometrus liangi*), two species names were wrongly translated. *Heterometrus laoticus* Couzijn, 1981 was called as “石异蝎” (the “rock different-scorpion”, if directly translated). “异蝎” is the formal Chinese name of the genus *Heterometrus* which will be further discussed. However, the word “石” means “stone” while the specific epithet is a Latinized toponym denoting the species’ distribution in Laos. *Centruroides limpidus* Karsch, 1879 was called “弯曲帝王蝎”.

However, “帝王蝎” is the Chinese equivalence of “emperor scorpion” which generally refers to the species *P. imperator* as mentioned before (“非洲波蝎” is also used in a Chinese scorpions book; the “African wave scorpion”, if directly translated). The specific epithet *limpidus* means “light”, from ancient Greek λάμπω (lámpō, “to shine”). It does not mean “bent (as in Chinese “弯曲”)”. In the college student thesis “沙漠蝎子体表感受器的仿生研究” by Huaxing Zhang (2018), two species in the article were wrongly identified. He used the vernacular name “巴基斯坦黄蝎背蝎”, which originally refers to the subspecies *H. tamulus gangeticus*, for *A. australis*, and used the formal Chinese name of *Mesobuthus* (now *Olivierus*) *caucasicus* (Nordmann, 1840), “高加索正钳蝎”, for *P. maximus*.

Several names can be contradictory within one Chinese paper, or the name of a certain taxon can differ among different papers. In the thesis “中国藏滇琼三省区蝎目分类区系研究（螯肢亚门：蛛形纲）” by Zhiyong Di (2009), there are several inconsistent Chinese names for certain taxa, or wrongly or incompletely translated names of Latin names. The first time when family Bothriuridae Simon, 1880 appeared, the author called it “穴居蝎科” (the “borrow-dwelling scorpion”; “科” stands for the Chinese equivalence of family rank) while it was subsequently termed as “穴尤蝎科” (cannot be literally translated; the Pinyin will be “xué yóu xiē kē”). The superfamily Chactoidea Pocock, 1893 was called “刚毛蝎总科” (the “seta scorpion”; “总科” or “超科” stands for the Chinese equivalence of superfamily rank; “超” is equal to “super” while “总” is equal to “overall”). However, the superfamily Pseudochactoidea Gromov, 1998, which only differs from the former in the prefix *pseudo-* (meaning “fake” or “false”), was called as “拟湿地蝎总科” (the “false wetland scorpion”). Since the word “拟” is equal to the meaning of the prefix, the author apparently referred to Chactoidea as “湿地蝎总科” which is inconsistent with the former parlance. The subfamily Superstitioniinae Stahnke, 1940 (now elevated to the family rank as Superstitioniidae) was wrongly translated as “幻蝎亚科” (“亚科” stands for the Chinese equivalence of subfamily rank). “幻” means “illusory”, “unreal”, “magical”, or “changeable”, but not “superstition”. However, this taxon was named after a place, Superstition Mountains in Arizona, USA. The family Vaejovidae Thorell, 1876 was wrongly translated as “狱神蝎科” which literally means “hell god scorpion”. Although the etymology of its type genus *Vaejovis* C. L. Koch, 1836 was indeed named after a god’s name, it has nothing to do with the Underworld (which will be further discussed below). The subfamily Urodacinae Pocock, 1893 (now elevated to the family rank as Urodacidae) seems to be transliterated. It was called as “拟尤里蝎亚科” in the paper as “尤里” (Pinyin “yóu lǐ”) may be the transliteration of the first three letters. However, the prefix “拟” was added for unknown reason as there is no prefix of equivalence in the Latin name. Superfamily Iuroidea Thorell, 1876 was transliterated as “尤蝎总科” (transliteration of the first two letters) but in other papers, there is an alternative name “巨蝎总科”. The name “巨蝎” (“giant scorpion”) is again used as the formal

Chinese name of genus *Pandinus* as seen in IUCN Red List of Threatened Species (Chinese edition). Similarly, family Microcharmidae Lourenço, 1996 was called in this paper “悦蝎科” (“pleasing scorpion”; wrongly translated), but as “小迷蝎科” (“little charming scorpion”; probably correctly translated, see below) in other papers. Family Caraboctonidae Kraepelin, 1905 was called in this paper “棘蝎科” (“spiny scorpion”; wrongly translated), but as “毛蝎科” (“hairy scorpion”; wrongly translated) in other papers. Family Troglotayosicidae Lourenço, 1998 was wrongly translated as “掘洞蝎科 (cave-digging scorpion)”. The name is a combination of prefix *troglo-* (meaning “troglobitic”) and a toponym, Caves of Los Tayos, Ecuador. The species under this family do not dig deep burrows by themselves; instead, they live in already existed natural caves. Superfamily Chaeriloidea Pocock, 1893 was wrongly translated as “豚蝎总科” or “豕蝎总科” (both of which mean “pig scorpion”), based on an erroneous etymology (ancient Greek χοίρος (choíros), meaning “pig”; the etymology will be further discussed below). Finally, family Liochelidae Fet & Bechly, 2001 (a junior synonym of Hormuridae Laurie, 1896) was translated as “链尾蝎科”. However, this is a correct translation of the family Hormuridae Laurie, 1896 as it derives from ancient Greek ὄφρος (hórmos) which means “a necklace (“项链”, in Chinese)” or “a chain (“锁链”, in Chinese)” and οὐρά (ourá) which means “tail (“尾”, in Chinese)”. Yet the formal Chinese name of Hormuridae was transliterated by the first three letters as “霍尔蝎科”.

In the thesis “中国蝎目分类与资源状况（螯肢亚门：蛛形纲）” by Dong Sun (2010), the Chinese name of Pseudochactidae was changed into “伪毛蝎科” (“伪” is another Chinese equivalence for the prefix), maybe to ensure the consistency of the translation of Chactidae; however, this conflicts with one of the formal names of Caraboctonidae (“毛蝎科”). Superstitioniidae was changed into “顶蝎科”, which might be a misunderstanding of the word “super” since “顶” means “top” in English. Urodacidae was changed into “尾煞蝎科”, which is half right (*uro-* means “tail” while *dakos* means “bite” or “sting”, meanings that are not considered for the Chinese word “煞”). Vaejovidae was wrongly transliterated as “瓦乔蝎科” as the original name of the god is Vejovis (Latin: Vēovis or Vēdiovis; rare Vēive or Vēdius) which sounds more like “维 (wéi)” in Chinese rather than “瓦 (wǎ)”. Subfamily Diplocentrinae Karsch, 1880 was translated as “双轴蝎亚科” (the “double-axis scorpion”) whereas other papers correctly translated it as “双棘蝎” (*diplos* means “two” and *kentron* means “spike”, referring to the subaculear tubercle on the telson). Several other names were also wrongly translated. Subfamily Megacorminae Karsch, 1881 was literally translated as “巨木蝎亚科” (the “giant wood scorpion”). Although κόρμος (kormos) itself does mean “tree trunk” or “log”, it also stands for “trunk” or “body” which hereby refers to the massive body of the scorpion. A closely related taxon, tribe Troglocormini Francke, 1981 was wrongly translated as “朽木蝎族 (“族” stands for the Chinese equivalence of tribe rank)”. This genus was based on the prefix *troglo-* and its sister genus *Megacormus*, alluding to its habitat and relationship. The

Chinese word “朽” literally means “rotten” which, in turn, “朽木蝎” is translated as “rotten wood scorpion”. Inconsistencies also exist in this paper. When the family Euscorpiidae Laurie, 1896 first appeared in this paper, it was correctly translated as “真蝎科” (prefix *eu-* strands for “true, real, good, beautiful” and “真” means “real”). But when it is referred as a subfamily (i.e., Euscorpiinae), its name changed into “欧蝎亚科”. Obviously, the author mistook the prefix as “Europe” (“欧” is the transliteration of Europe). Etymologically, the word “Europe” derives from ancient Greek combination of εὐρύς (eurys, “wide”) and ὄψ (ops, “face” or “eye”). If the scorpion’s name meant “European scorpion”, it should have been named an “Euroscorpius” instead. “异蝎科” (“different scorpion”) is a correct translation of family Heteroscorpionidae Kraepelin, 1905 (prefix *heteros-* means “different”) used in Chinese publications but arouses conflicts with the formal Chinese name designated for the genus *Heterometrus*. A fossil taxon, family Palaeoeuscorpiidae Lourenço, 2003 was translated as “古欧蝎科”. The prefix *palaeo-* was correctly translated (“古” means “old” or “ancient”), yet it seems that the author again changed the name of Euscorpiidae into “欧蝎科”. Another two fossil taxa were also wrongly translated. Family Protoischnuridae Carvalho & Lourenço, 2001 was translated as “原异蝎科”. The prefix *proto-* was correctly translated (“原” means “original” or “initial” in English), yet the second half was wrongly translated for unknown reason. The second half, derived from the family name Ischnuridae Simon, 1879 (a senior synonym of Hormuridae Laurie, 1896, although Hormuridae is considered as a valid name today) was correctly translated as “瘦尾蝎科” (“thin tailed scorpion”) in other papers (prefix *ischnos-* means “spindly, slender or thin”). Finally, family Palaeopisthacanthidae Kjellesvig-Waering 1986 was translated as “古豆蝎科” for unknown reason. The prefix *palaeo-* was correctly translated, but the second half comes from a genus under Hormuridae, genus *Opisthacanthus* Peters, 1861, which is a combination of *opisthe-* (behind) and *-akantha* (spine), yet the word “豆” means “a bean” in English. The problem of *Heterometrus*, *Heteroscorpion*, *Euscorpiops* and *Euscorpius* has already attracted attention in the Chinese academic circle (pers. comm. of Chinese scorpionologist Di Zhiyong).

Besides these suprageneric ranks, the formal Chinese names for several genera and species are also either wrongly translated or unrelated to the original meaning. Genus *Hottentotta* Birula, 1908 was named after the Hottentots (Khoikhoi), nomad pastoral people of Namibia and South Africa. Its formal Chinese name is “壕蝎属” (“属” stands for the Chinese equivalence of genus rank), apparently a transliteration of the first two letters. However, “壕” (háo) means “moat” or “ditch”, which may lead to the misunderstanding that all the species of this genus lives in soil pits. Genus *Lychas* C. L. Koch, 1845 is wrongly translated as “狼蝎属” (the “wolf scorpion”), based on an mistaken etymology, λύκος (lúkos or lykanos, “wolf”). The etymology of this name will be further discussed below. As mentioned before, *Buthus* was named as “钳蝎”, hence, *Mesobuthus* is

named as “正钳蝎”. However, the prefix *mesos* (μέσος) means “middle, intermediate”. This could be due to the relatively medium size of the type species, *M. eupeus* (C. L. Koch, 1839) (35–60 mm) when comparing with that of genus *Buthus* (*B. occitanus* (Amoreux, 1789), 60–80 mm). The prefix is often seen in many words, such as Mesopotamia (“between rivers”). In other fields, this prefix is never translated as “正” (e.g., “中生代” for “Mesozoic”). As in English, “正” usually means “upright” or “orthodox”, or “straight”, “positive”, “normal” and “correct”. There is one scorpion genus that can be more reasonably translated as “正钳蝎”, *Orthochirus*, as the prefix *orthos-* means “straight” or “upright”, and *chirus* means “hand” (for scorpions referring to the pedipalp chela). But its current formal Chinese name “直钳蝎” is flawless (“直” equals to “straight”), as the reason for naming it as *Orthochirus* results from the straight shape of its chela. The formal Chinese name for genus *Sassanidotus* Farzanpay, 1987 is redundantly translated as “萨钳蝎” since there is either no “buthus” or word that stands for “chela” presented in its name. “萨 (sà)” is apparently the transliteration of the first two letters, and the etymology will be discussed below. Genus *Olivierus* Farzanpay 1987 was initially wrongly translated as “橄榄蝎” (the “olive scorpion”). However, the genus name does not come from “olive”, but from the French entomologist, Guillaume-Antoine Olivier and it was correctly re-translated in a subsequent paper (Shi & Zhang, 2005) as “奥氏蝎” (“Olivier’s scorpion”). Incomplete translations are used for the genus *Tibetiomachus* Lourenço & Qi, 2006 and *Heterometrus*. The former is a combination of geographic modifier *tibet-* (Tibet) and genus *Iomachus* Pocock, 1893 (literally meaning “poisonous warrior”, from *ios-* and *makhētēs*). Yet its Chinese name is only designated as “藏蝎” (the “Tibetan scorpion”). The latter is a combination of *heteros-* and *metros* (measurement). The reason for naming as such is that the type species (the species that presents the characters of the genus, designated originally or subsequently) *Heterometrus spinifer* (Ehrenberg, 1828) was originally described in the genus *Buthus*. However, the morphological traits are inconsistent with the type species of the latter, thus a new genus was then established. Its formal Chinese name is “异蝎” (the “different scorpion”) which conflicts with another, correctly translated taxon, *Heteroscorpionidae* (see above). Similarly, genus *Isometrus* Ehrenberg, 1828 is simply translated as “等蝎” (“equal scorpion”), but there has been no conflict for now. The naming of two taxa, *Scorpiops* Peters, 1861 and *Euscorpiops* Vachon, 1980, are inconsistent and erroneous. The former is translated as “琵蝎” (“pipa scorpion”) while the latter, which merely added a prefix, is translated as “真蝎” (“real scorpion”). As mentioned before, Euscorpiidae was correctly translated as “真蝎科”, hence its type genus, *Euscorpius* Thorell, 1876 ought to be “真蝎属”. However, such naming of the genus *Euscorpiops* will lead to the confusion between it and the genus *Euscorpius*. The reason of naming *Scorpiops* as “琵蝎” is hereby conjectured. *Scorpiops* is a combination of genus *Scorpio* Linnaeus, 1758 and suffix *-ops*, while the suffix means “appearance”. As a result, those people may have

mistaken the meaning as “scorpionish scorpion” (they did not realize that the “scorpio” part actually stands for another genus rather than “a scorpion”). As mentioned above, the Chinese consider the scorpion body similar to the shape of the Chinese musical instrument, pipa “琵琶”. Consequently, “琵蝎” (the “pipa-shaped scorpion”) was named as an alternative for “蝎形蝎” (the “scorpion-shaped scorpion”). However, the etymology of this genus alludes to the similar morphology of these two genera. Nevertheless, even if the *Scorpiops* is called as “琵蝎”, “真琵蝎” should be the name of *Euscorpiops*, accordingly (in fact, *Euscorpiops* is now synonymized with *Scorpiops*.)

Finally, the formal Chinese names of several species are also either wrongly or disorderly translated. For example, *Lychas scutilus* C. L. Koch, 1845 is given a name as “盾狼蝎”. Though the suffix *scuti-* does mean “shield” (“盾” as in Chinese), *scutilus* is an independent word which actually means “slender”. If the specific epithet is an eponym, the formal Chinese names will either be a complete transliteration of a name or a transliteration of the first syllable followed by “氏” (denoting that the species was named after a person). Obviously, the simultaneous use of these two methods is disorderly as toponyms are also fully transliterated in China, which creates a confusion in whether the name is derived from a person or a place. In scorpions, one species’ name was wrongly transliterated. *Euscorpiops novaki* Kovářík, 2005 (now *Scorpiops novaki*) was completely transliterated as “诺瓦基真蝎” (the Pinyin of the first three words are “nuò wǎ jí”), which is similar to the pronunciation of “novaki”. However, “jí” is not included in the original name (Jindřich Novák, a Czech ichthyologist) but is a termination (masculine), which implies the specific epithet is named after a male person.

The examples given above demonstrate the confusion in the current Chinese names for scorpions. The problems presented by the amateur names result from a lack of sense of science and if the issue is not resolved, there will be more beginners confused with the puzzling names. Yet, even in the professional papers, names are chaotic likewise. This is a consequence of lacking a standardized (nationally recognized) translation regulation and an ignorance of the Chinese naming of scorpions since Latin names are academically the only important ones. The strong existence of this phenomenon can be proved by the only Chinese academic book for scorpions, *Scorpion Biology and Toxins* (Fig. 3). The consistent and ubiquitous problem in this book is the disordered employment of Latin names and Chinese names. Many species were called by their old Latin names (even considering the time of publication of this book, 2016) and some of them were wrongly spelled (even within a same species). The Chinese name for the same species (or genus, family) may not be consistent as well. For many species, names initially appeared in Latin only, while given Chinese names later (and some of them later again appearing only in Latin). In this case, both the inconsistent Chinese name and Latin name can appear solely, or together. Besides, using terms like “buthid” or “vaejovid” without explanation cannot make the beginners to understand

what they mean. This shows that even Chinese experts do not pay much attention to the names of scorpions, which will obviously cause confusion for those who do not know much about scorpions. There will be amateurs who search for domestic papers for intensive study and those confusing names are the obstacles in their way. In my opinion, the public should have a sense of scientific names, and scientific names are the only true names of the animals. Nevertheless, the Chinese public is mostly either unfamiliar with or good at memorizing Latin names. Therefore, Chinese equivalents are rather important for the knowledge of the animals. And in order to respect those who created Latin names, to reduce the confusion and to grasp a fundamental idea of the taxonomy (indicated by the Latin names), the formal Chinese names should better be correctly translated, based on the etymology of the Latin names as far as possible under a standardized regulation. The correctly translated Latin names (when possible) are merely equivalents in another language which do not alter the original meaning. All the Chinese names that are not related to the Latin names should be noted. The public should know that, in the context of biological science, there is no such thing as “original names”; the only valid, objective names given to animals are the Latin ones.

The present study formally proposes a regulation of translation of Latin names, and provides translations of all the valid extant scorpion species. This regulation is intended only for China (or may also be applicative to the countries sharing similar grammatical rules). However, there are some problems that need to be mentioned. As a matter of fact, I have been perfecting my translating method for years since I realized the chaos in the Chinese names of scorpions. All my translated names were published as articles online. Some people consider that common names are more likely to spread. However, this only results from the fact that the first impressions are firmly entrenched. In those amateur circles where formal names (most of which are correctly translated) are more abundant than common names, people use and memorize these formal names anyway. The only thing that matters is which name is pre-inculcated. Those who consider common names to be easily spread are merely comparing the translated names that appeared later with the common names they encountered first. No one has ever proved him- or herself to be capable of naming all the species regardless of the etymologies of their scientific names. Moreover, some radical people in China are fond of renaming the species after their morphology; but one cannot ensure the feature they use to be unique and unchangeable (it has to be, or there is no justified superiority over Latin names with the same problem). The species that were originally named after modern persons are usually the most common “victims”. There is a misguided sentiment among some Chinese public that memorizing the names of foreigners denigrates one’s own culture. Such behavior demonstrates disrespect of the original authors who created important eponyms naming species after their friends, colleagues, mentors, etc. Many of the eponyms were given after famous names (in scorpiology, such as Pocock, Simon,

Birula, or Vachon). Changing those names erases precious memory about personalities, and destroys the historical record of scientific discovery, as would do any arbitrary renaming of cities or streets or “canceling” historical figures and events.

Although numerous people either do not want to change the scorpion names they use (due to personal sentiment or habit), or consider it unimportant, more and more people are now accepting and using my translated names, either because of the popularization of these names by other keepers or traders, or the common view we share on this matter. This is solid evidence that the names for scorpions can be changed with effort and by time, and turning chaotic vernacular names into standardized translations is not as difficult or negative as some people may deem.

Actually, I later found that I was not the first one who proposed a standardization in Chinese animal names. Qiyu Hu (1991) discussed vernacular names applied in the nematodes that are parasitic on plants and criticized its limited usability in coining formal Chinese names. Cangsang Pan (1998) was the first to systematically translate all the mermithid names according to the etymology. Zhang (Zhisheng) et al. (2015) proposed the first advice on formulating Chinese names for spiders. Similar proposals appeared in botany. Already Changan Wang (1958) categorized several common situations in the etymology of plant scientific names, listed with examples. Yanwen Zhang (1992) argued that the Chinese names for plants should be standardized. Wang (Yuan) et al. (2013) proposed the Chinese naming regulation for plants. Wang (Xinguo) et al. (2012) also emphasized the danger that confusing Chinese names may bring in the professional areas (e.g., biological quarantine). Although I am not familiar with the plants (but I do know many plant names are rather hard to translate into Chinese even when the etymology is known, unlike in animals), these previous authors demonstrate that the standardization of Chinese name for living organisms is not an opinion of a single individual. The aim of this contribution is not to gain acceptance; instead, it provides all the true scorpion aficionados in China with a systematized reference, as well as a train of thought for the researchers in other fields in translating the Latin names (if they want to use translation instead of renaming).

Etymological diversity of scientific scorpion names

Scorpions are named in a variety of ways, reflecting the morphology, type locality, behavior, habitat, modern people name, ancient character or mythology, vernacular or native name, and taxonomic relationship. The present study will demonstrate the etymological diversity of scorpion scientific names in detail. All the names can be allocated into several categories which will be explained below. In addition, examples of generic and specific epithets of scorpions will be given in order to propose a new standardized translating regulation. The terminology (morphonyms, taxonyms, etc) follows James (2010) and Dupré (2016).

Abbreviations: Gr. = Greek; L. = Latin.

1. Morphonym

Morphonym (Gr. *morphe* form; *onuma* name) is the name that based on coloration and physical characters. It is one of the most common etymologies used in the nomenclature for both genus and species. The name can be a single word or a combination of several words. Sometimes the type of the specific epithet can be told from certain suffixes. For example, in *Opistophthalmus flavescens* Purcell, 1898 and *Centruroides nigrescens* Pocock, 1898, both of the specific epithets are a combination of a certain color (*nigros* for “black” and *flavus* for “yellow”) with the suffix *-escens* (becoming) that usually follows after the word indicating color. Similarly, in *Uroplectes olivaceus* Pocock, 1896 and *Javanimetrus cyaneus* (C.L. Koch, 1836), both of the specific epithets are combinations of a certain color (*oliva* for “olive-colored” and *cyan* for “greenish blue”) with the suffix *-aceus* (suffix *-āx* “inclined to” and *-eus*) or *-eus* (suffix indicating origin) that also usually follow after the word indicating color. These names can be classified as chromonyms (which will be considered separately from morphonyms in the Appendix). The morphonym can also be an adjective (e.g., *parvulus* = “dwarf”; *elongatus* = “prolonged”), a combination of an adjective and a body part (e.g., *cavimanus* = “sunken hand”), a structure or a pattern with a prefix or a suffix (e.g., *Bioculus* = “two eyed”; *trilineatus* = “three lined”; *spinifer* = “with spine”), a pattern without a prefix or a suffix (e.g., *vittatus* = “lined”), and a color with a type of a pattern (e.g., *flavostictus* = “yellow spot”) or a combination of several colors (e.g., *flavoviridis* = “yellow green”).

Although the morphonym can sometimes (rarely) be called a “charactonym”, the definition of the latter is hereby restricted to the features of a species that exclude the direct descriptions for phenotypic characters. For example, the specific epithet of *Pandinurus exitialis* (Pocock, 1888) means “lethal”; *Centruroides infamatus* C. L. Koch, 1844 was named for its infamous toxicity. Words that mean “fearsome” are also included here as I do not know whether an author’s impression was triggered by the appearance or toxicity. The morphonym in the Appendix is considered as “using specific body structures for naming” or “using explicit adjectives/prefixes/suffixes to describe a species or a genus (e.g., small, median, big, shiny, translucent, beautiful, colorful, simple, complicated and distinguished; adjectives that only suggest resemblance, uncertainty or difference will be excluded)”. Even if other types of names may indicate the morphology of the species, they are not hereby classified as morphonyms. Additionally, a chromonym is only defined as explicit description of color or color pattern (spots and stripes).

2. Taxonomy

Taxonomy (Gr. *taxis* arrangement; *onuma* name) is the name that suggests interspecific or intergeneric relationships (either morphologically or phylogenetically) or resemblances. It is usually in either the combination of two taxa or one taxon that is modified by a prefix or a suffix. For example, *Chaerilus pseudoconchiformus* Yin, Qiu, Pan, Li & Di, 2015 was named after *Chaerilus conchiformus* Zhu, Han & Lourenço,

2008 with a prefix *pseudo-* (fake) indicating the similar morphology while not being the same species. *Heteroscorpion opisthacanthoides* (Kraepelin, 1896) was named after the genus *Opisthacanthus* with suffix *-oides* (resembling). *Parascorpiops* Banks, 1928 was named after *Scorpiops* with prefix *para-* (close to, nearby). *Pandinopsis* Vachon, 1974 was named after *Pandinus* with suffix *-opsis* (appearance, same with *-ops*). *Tityobuthus* Pocock, 1893 is a combination of the genera *Tityus* C. L. Koch, 1836 and *Buthus*. A similar case is *Cicileurus* Teruel, 2007, which is a combination of the genera *Cicileus* Vachon, 1948 and *Leiurus*. However, not all the generic names named after another with a prefix indicate the close relationship or resemblance. For example, *Microbuthus* Kraepelin, 1898 only means “a small buthid (buthid stands for the taxa that are under Family Buthidae C. L. Koch, 1837)”. Nevertheless, it still serves as a taxon as it indicates its subordinate relationship with the family Buthidae. Additionally, some taxonyms will be misleading if the relationship indicated by the original author is erroneous. For instance, the genus *Pseudochactas* Gromov, 1998 was named after *Chactas* Gervais, 1844. Yet, the former genus is not related to the latter, but to *Buthus* and *Chaerilus* Simon, 1877 instead. In the specific epithet, however, some adjectives also indicate relationships and these names do not state which species do they resemble.

The taxonomy in the appendix is considered as “contains another genus/species name or other genera names”, “uses prefix or suffix that suggest resemblance, uncertainty or difference” and “indirectly suggests resemblance, uncertainty or difference by using adjectives (e.g., similar, close, uncertain, fake, problematic, intermediate, half, dubious, confusing and deceiving)”.

3. Toponym

Toponym (Gr. *topos* place; *onuma* name) is the name of the type locality (or at least labeled so) of the species or the genus, which is usually ended with suffix like *-ensis* (e.g., *Neochactas sarisarinamensis* (González-Sponga, 1985)), *-us* (e.g., *Compsobuthus pakistanus* Kovařík & Ahmed, 2007) or *-ia* (e.g., *Microtityus eustatia* Armas, 2018). The toponym can also be in the generic epithet which is usually modified by a prefix (e.g., *Aegaeobuthus* = buthid of the Aegean Region). Additionally, the name of the place of itself can also be Latinized as the genus name (e.g., *Karasbergia* Hewitt, 1913, named after the Karasberg Hill in Northern Cape, South Africa). This name can be classified as a oronym which is named after a mountain. More precise terms within the toponym like insulonym (or nesonym, e.g., *Hottentotta socotrensis* (Pocock, 1889)), limnonym (e.g., *Uroplectes malawicus* Prendini, 2015), oceanym (e.g., *Serradigitus pacificus* (Williams, 1980)), potamonym (e.g., *Hottentotta niloticus* (Birula, 1928)) and speleonym (e.g., *Tityus grottoedensis* Botero-Trujillo & Flórez, 2014) are used for islands, lakes, oceans, rivers and caves, respectively.

Toponym is a general word while choronym is used for places like a region, a country or any other territories. This

concept hereby (in the appendix) only refers to a rough geographic range like “from southern region (*australis*)”. Sometimes, the toponym is not a geographical place. Econym (or oeconomy, oikonym) is a general word used for any inhabited settlement or place. The astionym is coined exclusively for names that used in apposition to cities and towns (e.g., *Neobuthus erigavoensis* Kovařík, Lowe, Awale, Elmi & Hurre, 2018) and comonym for villages (e.g., *Isometrus amboli* Shauri, Dandekar, Padhye & Bastawade, 2020). The term ecodonym is used to refer specifically to a building as an inhabited place. For example, *Razianus Farzanpay*, 1987 was named after Institute Razi in Iran; *Kovarikia oxy* Bryson, Graham & Soleglad, 2018 was named after the nickname of Occidental College; *Tityus imei* Borges, de Sousa & Manzanilla, 2006 was named after the abbreviation of Instituto de Medicina Experimental, and it is also an acronym (a term named by the initials); likewise, *Tityus ivicnancor* González-Sponga, 1997 was named after the abbreviation of Instituto Venezolano de Investigaciones Científicas and Latin *nancor* (found). Slightly different, *Akrav israchanani* Levy, 2007 was named after the type locality (Israel) and its finder Chanan Dimentman, thus making it a combination of a toponym and an eponym (see below).

Sometimes a name may be a metonym. For example, *Uroctonites sequoia* (Gertsch & Soleglad, 1972) was named after the Sequoia National Park; *Pseudouroctonus peccatum* Tate, Riddle, Soleglad & Graham, 2013 was named for its type locality being near Las Vegas (the “Sin City”) and the specific epithet means “sin” in Latin; the specific epithet of *Auyantepua aurum* Ythier, 2018 means “gold” in Latin as there had been a gold rush in its type locality, Saül, during the early 19th century; the specific epithet of *Konetontli ignes* González-Santillan & Prendini, 2015 itself is the Latin word for “fire” and the name of its type locality Fogos is the Portuguese word for “fires”. A special case is for the genus *Sassanidotus*, which was named after Sassanide dynasty, an empire that was in Persia (now Iran), alluding its locality. This case can be classified as the paleonym (the ancient name for a place) and will be considered separately from the toponym in the Appendix.

The toponym in the Appendix is only considered as “using the modern name of a place (no restriction on its range or type)” or “using metonym to allude to a place”.

4. Eponym

Eponym (Gr. *epōnumos* ‘named after’) is a name that commemorates a person. There are various suffixes indicating it is a person’s name, such as *-i*, *-ii*, *-ius*, *-ae*, *-um*, *-ia* and *-us*. The former four are usually seen in specific epithets while the last two in generic ones (*-oides* is rarely seen but *Simonoides* Vachon & Farzanpay, 1987 (a junior synonym of *Orthochirus*) is an example). For instance, *Birulatus* Vachon, 1974 was named after the Russian scorpionologist, Alexei A. Byalynitskii-Birula. A consonant “t” was added to ensure it reads smoothly. In a specific epithet, it ends with *-i*, as in *Buthacus birulai* Lourenço, 2006. Likewise, when a genus was named after

the German arachnologist, Carl Ludwig Koch, his last name was transformed into *Kochius Soleglad & Fet*, 2008 but ended with *-i* when served as a specific epithet; e.g., *Franckeus kochi* (Sissom, 1991). For a woman's name, it usually ends with *-ae*. If the name consists of multiple names, the termination will be *-orum* (masculine) or *-arum* (feminine). The eponym can also be a combination of a person's name and a name of a related genus (e.g., *Hoffmannihadrurus* Fet & Soleglad, 2004 was named after a Mexican scorpionologist, Carlos C. Hoffmann and its sister genus *Hadrurus*). To be more specific, the term "anthroponym" is used for a person's name and especially his/her last name, which is often seen in many taxa. There are also terms like "patronym" or "matronym" (or "metronym"), which indicate a name derived from that of the father (or a paternal ancestor) and the mother (or a maternal ancestor), respectively (in the Appendix, these two are considered for names after author's parents). The term "necronym" is used for someone who had died when the species was found. This name is rarely seen in the scorpions, however, the gecko *Phelsuma hielscheri* Rösler, Obst & Seipp, 2001 was named after Michael Hielscher who was shot by a Malagasy soldier shortly after the species was found. The junior synonym of *Olivierus martensi*, *Buthus confucius* can also be classified as a "hagiology" (or agionym), which commemorates the Chinese saint Confucius (Kongzi, 孔子). Besides the name of a specific individual, an eponym can also be an ethnonym or demonym that used for a native inhabitant, tribe or ethnic group, which is more often seen in scorpions. *Buthus nabataeus* Lourenço, Abu Afifeh & Al-Saraireh, 2021 was named after the Nabataeans, ancient Bedouin people who inhabited northern Arabia and the southern Levant.

Eponym does not always have to be the name of a modern person or ethnic group. For example, *Timogenes* Simon, 1880 was named after Timagène (Τιμαγένης), a Greek historian from 1st century B.C.; *Chaerilus* was named after Choerilus (Χοιρίλος), a Greek epic poet; *Belisarius* Simon, 1879 is the homonym (Βελισάριος) of a general of the Byzantine Empire; *Urophonius eugenicus* (Mello-Leitão, 1931), named after Marcus Eugenius, the archbishop of Ephesus; *Pachakutej Ochoa*, 2004 is the homonym of the Ninth Inca sovereign from XVth century; *Hottentotta schach* (Birula, 1905), named after Shah, a king in Farsi (now Iran).

Additionally, an eponym can be a "mythonym" when taken from a mythological or folklore character. If the name is from a god or goddess, it can be called a "deonym" (or "theonym"). Such tendency is seen in the species named by Carl Ludwig Koch and Eugène Simon (a French arachnologist), as well as in many recent names. Examples in generic names are as follows: *Teuthraustes* Simon, 1878, named after Teuthras (Τεύθρας), king of Mysia in Greek mythology; *Zabius* Thorell, 1893, named after the king of Hyperboreans in Greek mythology; *Oiclus* Simon, 1880, named after Oïclus (Οϊκλῆς), father of Amphiarus in Roman mythology; *Hadogenes* Kraepelin, 1894, named after Hades (Ἄδης), the god of the underworld in Greek mythology; *Vaejovis* C. L. Koch, 1836, named after Vejovis,

a god of healing in Roman mythology; *Lychas* C. L. Koch, 1845, named after Lichas (Λίχας), Hercules' herald in Greek mythology; *Calchas* Birula, 1899, named after Kalkhas (Κάλχας), a Greek seer or priest; *Broteas* C.L. Koch, 1837, named after Broteas (Βροτέας), son of Tantalus in Greek mythology; *Tityus* C. L. Koch, 1836 named after Tityos (Τίτυος), a giant in Greek mythology (and additionally a subgenus, *Tityus (Atreus)* Gervais, 1843, named after Atreus (Ατρέος), a king of Mycenae in Greek mythology); *Chaneke* Francke, Teruel & Santibáñez-López, 2014, named after the Chanekes, legendary creatures in Mexican folklore; *Maaykuyak* González-Santillan & Prendini, 2013 is the Kiliwa for "god of the warrior". Examples in specific epithets are as follows: *Heterometrus silenus* (Simon, 1884), named after Seilénós (Σειληνός), a god of the forests in Greek mythology; *Srilankametrus caesar* (C.L. Koch, 1841), named after Gaius Julius Caesar, a Roman General and politician; *Androctonus aeneas* C. L. Koch, 1839, named after Aineá̄s (Αίνεά̄ς), a Trojan hero; *Buthus ajax* (C. L. Koch, 1839), named after the Trojan hero Aias (Αἴας); *Buthus halius* (C. L. Koch, 1839), named after a Trojan soldier, Ἀλιόν; *Buthus paris* (C. L. Koch, 1839), named after Paris (Πάρις), prince of Troy; *Mesobuthus eupeus* (C.L. Koch, 1839), named after Epeius (Ἐπειός), a Greek soldier who helped to built the Trojan Horse; *Mesobuthus thersites* (C. L. Koch, 1839), named after Thersites (Θερσίτης), a Greek soldier who was fond of fighting and insulting; *Jaguajir agamemnon* (C.L.Koch, 1839), named after Agamémnōn (Ἀγαμέμνων), king of Mycenae and the leader of the Greek army in the Trojan war; *Hadogenes tityrus* (Simon, 1888), named after Tityre, a shepherd in Greek mythology; *Scorpiops artemisae* (Kovařík et al., 2015) and *Scorpiops orioni* (Kovařík et al., 2015), both named after two Greek characters who are related with the constellation of Scorpio; *Birulatus astartiae* Stathi & Lourenço, 2003, named after Astarte, an ancient goddess of earth and fertility who was worshiped in the area where this species was collected (the name was inspired by the scorpion digging burrows in the rocky desert); *Femtobuthus shutuae* Lowe, 2010, named after Shutu, a Babylonian goddess of the South Wind (a reference to the night winds in the type locality); *Microbuthus satyrus* Lowe et al., 2018, named after sátyros, a male natural spirit in Greek mythology; *Hadruroides inti* Ythier, 2021, named after the Incan sun god; *Hadruroides pachamama* Ythier, 2021, named after the Incan earth goddess; *Orthochirus krishnai* Tikader & Bastawade, 1983, named after Krishna, a Hindu deity whose name means "blue" in Sanskrit, also a pun denoting the color of the scorpion; *Chactopsis chullachaqui* Ochoa et al., 2013, named after a mythical spirit of the forest with unequal feet (Quechua words, *chulla* and *chaqui* meaning "unequal foot"); *Chactopsis curupira* Ochoa et al., 2013, named after a mythical creature from the folklore of Brazilian Amazonia; *Megachactops kuemoi* Ochoa et al., 2013, named after a deity from the folklore of Piaroa of Venezuelan Amazonia; *Tityus curupi* Ojanguren-Affilastro et al., 2017, named after Curupí, a goblin of the Guaraní mythology (the legend says

that it chases women in the forests when they venture alone to get firewood); *Teuthraustes newaribe* Lourenço et al., 2011, named after mischievous entities called “nè waribé” or “nè waripé”, who bring disease and death in the Yanomami folklore; *Diplocentrus diablo* Stockwell & Nilsson, 1987, named after a fictional entity, a noun in apposition corresponding to the Spanish word for “evil” (scorpions are the consorts of evil forces for Hispanic locals); *Alacran chamuco* Francke, 2009, named after name of an underworld devil used in parts of Mexico. The invalid names which are also mythonyms are omitted here.

Other eponyms come from the characters of fictional novels: *Chactas*, named after a Natchez Indian character in François-René de Chateaubriand’s novel *Atala, a noble savage*; *Centruroides rodolfoi* Santibanez-Lopez & Contreras-Félix, 2013, named after Rodolfo (Rudolph), the red-nose reindeer which brings hope, peace and joy on Christmas holidays; *Vaejovis boggins* Azzinnari et al., 2021, named after the fictional character Bilbo Baggins in J.R.R. Tolkien’s *The Hobbit* in reference to its small size.

Finally, there are also several eponyms which were given after a group of people, a non-human entity, or occupation: *Euscorpius studentium* Karaman, 2020, named after a group of college students of the Faculty of Sciences in Novi Sad who initiated the cave expedition, leading to the discovery of the new species; *Chactas oxfordi* González-Sponga, 1978 commemorates the collectors of the “Club de Exploradores de la Universidad de Oxford”; the specific epithet of *Mesobuthus brutus* Fet et al., 2018 is a noun in apposition which refers to a famous Czech rock band; the specific epithet of *Vaejovis vaquero* Gertsch & Soleglad, 1972 is a Spanish word for “cowboy”; *Paravaejovis puritanus* (Gertsch, 1958) was named after Puritan-American Museum Expedition; *Bothriurus jesuita* Ojanguren-Affilastro, 2003 was named after the Spanish name for Jesuit catholic order since the species has been collected near the ruins of the missions that the Jesuit order constructed in the XVII and XVIII centuries; *Neobuthus factorio* Kovařík et al., 2018 was named after the computer game (Factorio) created by the son of the first author, Michal Kovařík. In conclusion, the eponym can be given after a commemoration, a personal interest of the author, a pun, a metonym of a locality, or an allusion to the scorpion’s morphology, behavior or habitat.

The eponyms in the Appendix is only considered as “named after a modern, fictional or historical character, or even a group of people or a symbolic figure”. Names given after gods will be separately classified as deonyms; names given after mythological or folkloric characters, as mythonyms; names after ethnic groups, as ethnonyms. Patronyms, matronyms and necronyms are excluded from the eponyms and will be considered separately.

5. Bionyms

Bionym (Gr. *bios* life; *onuma* name) is a name that directly or indirectly describes the type of habitat and environmental conditions. A toponym that describes a certain geography

can be called a geonym, which is applied in the Appendix. Most of the generic epithets in this category are just modified with a prefix, such as *trogl-* (cave, e.g., *Troglorhopalurus* Lourenço, Baptista & Giupponi, 2004) or *oro-* (mountain, e.g., *Orobothriurus* Maury, 1975). As a result, they can also be considered as taxonyms. Some bionyms can be somewhat obscure. The prefix of *Sotanochactas* Francke, 1986 (i.e., *sotano-*) is the Spanish word for “pit” (as a result, this prefix is also an autochthonym, see below), which refers to the type locality of the type species *S. elliotti* (Mitchell, 1971), Sótano de Yerbaniz. Sometimes the etymology of a bionym can be a mythonym. The prefix of *Stygochactas* Vignoli & Prendini, 2009 (i.e., *stygo-*) is the underworld river, Styx, in Greek mythology. Another special case is *Rumikiru* Ojanguren-Affilastro et al., 2012, a name constructed of two Quechua words, *rumi* (stone) and *kiru* (tooth), which signify that the species inhabits a rocky area and has an enlarged tooth on the movable finger of the pedipalp. Apparently, this name is a combination of morphonym and bionym, while also an autochthonym as a whole. Examples of specific epithets that are bionyms are more abundant and some are not the direct description of the habitat. The specific epithet of *Vietbocap quinquemilia* Lourenço et al., 2018 (= *V. canhi* Lourenço & Pham, 2010) means “5000 meters”. It is the distance between the entrance of the cave and the place where the species was found. The specific epithet of *Brachistosternus kamanchaca* Ojanguren-Affilastro, Mattoni & Prendini, 2007 is a noun in apposition, which is the local name (autochthonym) for sea fog occurring along the arid Pacific coastline of central and northern South America. The specific epithet of *Paruroctonus ventosus* Williams, 1972 means “like the wind, speedy” in Latin, a metonym for the original habitat, which is characterized by prevalent wind and little shelter from it. Bionyms may refer to the climate and temperature: e.g., the specific epithet of *Oiclus ardens* Ythier, 2019 alludes to the geothermal activity and many hot (ardent, Latin *ardens*) springs located in the area where the new species was found. The specific epithet of *Serradigitus calidus* (Soleglad, 1974) means “warm, hot” in Latin, based on the hot climate of the Cuatro Ciénegas basin of Coahuila, Mexico. The specific epithet of *Serradigitus torridus* Williams & Berke, 1986 means “burning” in Latin, a reference to hot, dry desert habitat. Other bionyms may refer to the microhabitat and substrate type: e.g., *Kochius colluvius* Ayrey, Jones & Myers, 2019 was named after the colluvial soil where the type specimens were found. Similarly, *Microtityus vulcanicus* Teruel, 2019 was named after volcanic soil of the habitat to which this species seems to be endemic (caactus scrub that grows on very dark, volcanic sandy soil; all specimens were found under black, volcanic sandstone rocks). *Tityus rupestris* Lourenço 2019 was named after the Campo Rupestres biotype. The word *rupestris* itself comes from the Latin *rūpestris* (living on cliffs or rocks). *Brachistosternus quiscapata* Ochoa & Acosta, 2002 was named after two Quechua words (an autochthonym), *quisca* for spine and *pata* for spiny place, referring to the habitat with cacti. The etymology of the specific epithet of *Brachistosternus ninapo*

Ochoa, 2004 is more interesting. It is the combination of *nina poqchiq orco*, “volcano” in Quechua language (an autochthonym). Both specific epithets of *Diplocentrus actun* Armas & Palacios-Vargas, 2002 and *Diplocentrus cueva* Francke, 1978 mean “cave”, except that the former is Maya language and the latter, Spanish.

6. Autochthonym

Autochthonym (Gr. *autokhthon* indigenous, native; *onuma* name) is a name used by the natives. For the generic epithets in scorpions, when an autochthonym is chosen, it is usually the word for “scorpion” in an indigenous language. Most autochthonyms in scorpion scientific names are classified as zoonyms (a general word for name given after an animal). For example, *Aemngvantom* Prendini, Ehrenthal & Loria, 2021 is the Laotian word for “scorpion”; *Gint* Kovařík et al., 2013 is the Amharic word for “scorpion”; *Jaguajir* Esposito et al., 2017 is the Tupi word for “scorpion”; *Tehuankea* Cekalovic, 1973 is the Araucana word (*tehuánque*) for “scorpion”; *Kuarapu* Francke & Ponce-Saavedra, 2010 is the Purhépecha word for “scorpion”; *Kolotl* Santibáñez-López, Francke & Prendini, 2014 is the Nahuatl word for “scorpion”. Two special cases are: *Alacran* Francke, 1982, which is the Spanish word for “scorpion”, and *Akrav* Levy, 2007 is the Biblical Hebrew word for “scorpion”, both of which implicitly indicate the locality of the species (Mexico and Israel). Similar examples can be seen in several specific epithets. *Pandinurus hangarale* Kovařík et al., 2017 was named after the Somali word for “big black scorpion”; *Pandiborellius igdu* Kovařík et al., 2017, after the Afar word for “scorpion”; *Parabuthus kajibu* Kovařík et al., 2016, after the Oromia word for “scorpion”; *Tityus kukututee* Ythier, Chevalier & Gangadin, 2020, after the Ndyuka word for “scorpion”; *Hottentotta vinchu* Mirza, Ambekar & Kulkarni, 2019, after the Marathi word for “scorpion”; *Troglorhopalurus lacrau* (Lourenço & Pinto-da-Rocha, 1997), after the Portuguese word for “scorpion”; *Diplocentrus sinaan* Armas & Martin-Frias, 2000, after the Maya word for “scorpion”; and *Ananteris sipilili* Ythier, Chevalier & Lourenço, 2020, after the Kalina word for “scorpion”. Sometimes an autochthonym does not mean “scorpion”, such as *Konetontli* González-Santillan & Prendini, 2013 is the Nahuatl word for “infant, small creature”. Additionally, an autochthonym can be a metonym given after the type locality or morphology. *Diplocentrus oxlajujbaktun* Trujillo & Armas, 2012 was named after Oxlajuj B’ak’tun, 394 years cycle in the Mayan calendar. *Thorellius yuyuawi* González-Santillan & Prendini, 2018 was named after the word for grains of black maize in the language of the Wixarika people. According to the original authors, the name refers to the smoothness and dark color of the integument, especially the chelae, of this species, which resembles kernels of black maize.

Finally, aside from the zoonyms and metonyms, an autochthonym in the specific epithet can also be a morphonym (e.g., *Buthus bonito* Lourenço & Geniez, 2005 is Spanish for “beautiful”, *Tityus dedoslargas* Francke & Stockwell, 1987 is Spanish for “long fingers”); a chromonym (e.g., *Grosphus*

mavo Lourenço & Rossi 2020 is Malagasy for “yellow”); an enthomym (e.g., *Buthus manchego* Teruel & Turiel 2020 is the Spanish word used locally to name the natives of Castilla-La Mancha); a toponym (e.g., *Tityus quisqueyanus* (Armas, 1982) is the native name (Quisqueya) for the Hispaniola Island); a choronym (e.g., *Vaejovis norteno* Sissom & González-Santillán, 2004 is the Spanish word *norteño*, “northern”); a bionym (e.g., *Centruroides cuauhmapan* Goodman, Prendini, Francke & Esposito, 2021 is Nahuatl for “up in a tree”); a geonym (e.g., *Troglotayosicus muranunkae* Sanchez-Vialas, Blasco-Arostegui, Garcia-Gila & Lourenço, 2020 is the Shuar word (Mura Nunka) for “the vegetation formations of the sandstone plateaus that characterize the region”); an ergonym (see below; e.g., *Thorellius tekuani* González-Santillan & Prendini, 2018 is Nahuatl for “ferocious”); and an axionym (see below; e.g., *Pachakutej iskay* (Acosta & Ochoa, 2001) is Quechua for “two” (the second species from Peru)). Autochthonyms used as eponyms (e.g., *Bothriurus jesuita*), mythonyms (e.g., *Chactopsis chullachaqui*) or deonyms (e.g., *Maaykuyak*) were already listed before.

For the convenience of categorizing, all the names that originate from languages except for English (scorpion), Greek (*skorpios / scorpio*) and Latin (*scorpius, nepa*) and taken in apposition will be classified as autochthonyms in the Appendix, no matter what they indicate, but they will be further explained in the parentheses. The name that originates from a native language is termed a glossonym (glottonym) or linguonym.

7. Ergonym

Ergonym (Gr. *ergon* work, occupation; *onuma* name) is a name that usually describes behavior of a species. For the generic epithet, the only existing case in scorpions is *Trypanothacus* Lowe et al., 2019, a combination of Greek word *τρυπάνι* (trypaní, “drill”) and genus name *Buthacus* Birula, 1908 as a reference to the habit of burrowing in more consolidated soils by these scorpions. However, generic names like *Androctonus* will also be classified in this category in this study, where a name represents the aggressiveness of the scorpion. For the specific epithet, it usually presents an implied importance or identity in scorpions. The most famous case is *Pandinus imperator* (originally as *Buthus imperator*) whose specific epithet stands for “a commander, a leader, or an absolute ruler” derived from the Latin verb *imperare* which means “to command, to order”. The English word “emperor” is derived from this word. This might be a reference to the massive body size of *P. imperator* as it is the third largest scorpion in the world (total length about 220 mm); in fact, at the time of its description it could be the largest known species (the currently largest, although not the longest, scorpion is *Gigantometrus swammerdami* (Simon, 1872), described 31 years later). A similar case is the *Pandinopsis dictator* (Pocock, 1888) which might follow the same naming trend as it means “dictator”. This is also a species of large size, up to 200 mm. Other cases are more likely to be based on the behavior. The species epithet of *Opistophthalmus fossor* Purcell, 1898 means “burrower”,

which describes the digging behavior of the species. The species epithet of *Opistophthalmus praedo* Thorell, 1876 means “robber” which might imply that the species was discovered when it was scrambling for prey, or it might had taken the burrow of others as its own. *Pandipalpus viatoris* (Pocock, 1890) may be named for its wide distribution as *viatoris* means “traveller”. Obviously, both *Tityus pugilator* Pocock, 1898 and *Pandinops pugilator* (Pocock, 1900) are named for their habits of attacking enemy with their pedipalps as *pugilator* means “boxer”. The reason why *Opisthacanthus piscatorius* Lawrence, 1955 was named after the Latin word *piscator* (fisherman) is unknown. The species is endemic to the West Cape of South Africa. To be more specific, it was found in Hangklip, Overstrand Municipality, a place which is near the sea. The scorpion might have been found scavenging for dead fish on the beach nearby (scorpions are not agile enough to catch living fish, and they cannot detect them from outside of water in the first place).

Other names used for describing the habits of a species will be classified as ergonyms in this paper.

8. Tautonym

Tautonym (Gr. *tauto* the same; *onuma* name) is a scientific name, in which the generic and the specific epithets are the same (also called an autonym). Such a name is usually the name of a type species. Strictly speaking, there is only one case in the scorpions, which is *Hottentotta hottentotta* (Fabricius, 1787). However, there are other similar cases which both the generic and the specific epithets have the same meaning. These cases can be termed as a typonym in which the genus is named after its type species. For example, the generic and the specific epithets of *Vizcaino viscainensis* (Williams, 1970) mean the Vizcaino Desert on the west coast of the central Baja California peninsula. The generic epithet of *Aemngvantom lao* (Lourenço, 2012) is “scorpion” in Laotian while its specific epithet is its country of origin. One can see from the parentheses that both of the species were not originally assigned to these genera. Their newly described genera directly took the etymologies of their specific epithets as the generic names. Actually, the case of *H. hottentotta* is the same as it was initially described as *Scorpio hottentotta* by Fabricius. Similarly, both the generic and the specific epithets of *Darchenia bernadettae* Vachon, 1977 commemorate the French entomologist, Bernadette Darchen. And there is another slightly different case. The generic epithet of *Kuarapu purhepecha* Francke & Ponce-Saavedra, 2010 is the “scorpion” in Purhépecha language, the name of which was directly taken as the specific epithet.

9. “Ordonym”

A rare trend of naming scorpions by Greek letters is continued by some recent authors. The first such group were *Alpiscorpius alpha*, *A. beta* and *A. gamma* by Di Caporiacco (1950; originally named as three subspecies of *Euscorpius germanus*), followed by *A. delta*, *A. kappa*, *A. lambda*, *A. omega*, *A. omikron*, *A. sigma* and *A. ypsilon* by Kovařík et al. (2019). The rarely used word “ordonym” (L. *ordo* order;

Gr. *onuma* name)” is hereby applied only to accommodate this special case. Besides, sometimes the species name also represents subjective judgement, such as words like “expected”, “unexpected” and “important”. These names are hereby classified within the axionyms.

New nomenclature for the Chinese names of scorpions

1. General approach

As mentioned in the beginning, the current Chinese names for scorpions are rather confusing and inconsistent. One species could be assigned multiple names and vice versa. Also, the name may not be indicative for the taxonomy, or it is not the Chinese equivalence of Latin name in meaning. It is either unfavorable for the public cognition or for the amateur study. As such, the major aim of this work is to provide standardized translation rules in Chinese for the Latin names of the scorpions. The etymology of scientific Latin names of scorpions is rather diverse. Hence, the rules can only be enforced when the etymology of every species is investigated. Since I have already translated names of all valid species, the suggested regulation is now complete. The core principles of this regulation are: (i) be precise and concise as far as possible; (ii) no arbitrary alteration without the original explanation unless the etymology is unknown; (iii) the translation of the same word is unified but also emphasizes the easiness of spoken speech if necessary. The basic and the most important rule is *not to change the meaning* as far as possible. The most conservative translation ensures the lowest possibility of future conflicts.

Since most of the etymology of the scientific names that will be mentioned below have been explained before, they will not be repeated in detail if unnecessary.

Note: the following content will only provide the Chinese translation of the genus names without the English equivalence. For the detailed list of species, refer to the Appendix.

In the Appendix 1, the genus names of unknown etymology will be noted with #; the genus names that are translated by its junior synonym will be noted with @. If the classification or the validity of the taxon is controversial, it will be noted with *. Species with ★ are the ones that are endemic to China; species with ☆ are the ones with confirmed records in China; species with ○ are the ones with dubious records in China.

Please note that no subgenus, species-group or species-complex will be included in the Appendix 1. All the currently recognized subgenera are presented in the Appendix 2. The appendix will only provide key information of the etymology of each species, subspecies, genus and subgenus described after 2016 (for the detailed explanation of taxa described in or before 2016, please refer to Dupré’s dictionary).

Additionally, all the scientific names will be classified into the following categories by the abbreviations as shown in the brackets: autochthonym (^{au}), axionym (^{ax}), bionym (^{bi}), charactonym (^{cha}), choronym (^{cho}), chromonym (^{chr}), deonym (^{de}), eponym (^{ep}), ergonym (^{er}), ethnonym (^{er}), geonym (^{ge}),

linguonym (^l), matronym (^{ma}), morphonym (^{mo}), mythonym (^{my}), necronym (^{ne}), ordonym (^{ord}), paleonym (^{pal}), patronym (^{pat}), tautonym (^{tau}), taxonym (^{ta}), toponym (^{to}, including the astionym, comonym, conym, insulonym, limnonym, oceanonym, oronym, potamonym and speleonym), and typonym (^{ty}). However, the following regulation will only be discussed in general categories.

2. Generic epithet

2.1 Morphonym

2.1.1 If the etymology is clear, such as a morphonym that is combined of several independent parts, use literal translation without arbitrarily changing the original meaning or adding to translation.

E.g. *Androctonus crassicauda* is literally translated as “肥尾杀人蝎”.

2.1.2 If the literal translation is too simple and equivocal, use free translation only when there is explanation in the original paper.

E.g. The literal translation of *Rumikiru* is “石齿蝎”, however, this will lead to misunderstanding that the tooth of the scorpion is stone-like, which is inconsistent with the original meaning (see above). As a result, it is better to be paraphrased like “石栖巨齿蝎”.

2.1.3 The name is best to be catchy when reading. The name used for translating a body structure is best to be uniform unless it does not read smoothly.

E.g. The part “manus” can be seen in both *Compsobuthus brevimanus* and *Diplocentrus longimanus*, hence they are translated as “短掌秀杀牛蝎” and “长掌双棘蝎”, respectively by keeping “manus” unified as “掌”. However, *Srilankametrus gravimanus* is translated as “沉鳌斯里兰卡异距蝎”, turning “掌” into “鳌”.

2.2 Taxonym

2.2.1 If a genus is named basing on another genus, then the complete translation of the original genus should be kept in order to indicate the derivation.

E.g. *Srilankametrus* was named based on the *Heterometrus*, and the latter is translated as “异距蝎”. As a result, *Srilankametrus* should be translated as “斯里兰卡异距蝎”.

2.2.2 If a genus name is a combination of two generic names, then the translation will also be the combination of two translations.

E.g. *Broteochactas* Pocock, 1893 is a combination of *Brotereas* (“猎人蝎”, see below) and *Chactas* (“蚕蝎”, see below), so it will be translated as “猎人蚕蝎”.

2.2.3 If the genus name is in a form of “prefix/suffix + original genus name”, then the translation of the prefix/suffix is best to be uniform (e.g., *pseudo*-拟, *-ops*类, *-opsis*仿, *-oides/-odes*似, *-olus*小, *an-*假, *apisto-*伪, *eu-*真, *hetero-*异, *xeno-/anomalo-/allo-*异/诡/奇/歧, *iso-*等, *neo-*新, *palaeo-*古, *opith-/opisto-*后, *meso-*中, *hemi-*半, *ortho-*直, *plesio-*邻, *pan-*泛, *micro-*微, *pico-*侏, *femto-*毫, etc.; note that these prefixes or suffixes will not only occur in taxonyms). If the differently spelled prefix or suffix is of same meaning, they should be

translated with synonyms or use free translation.

E.g. The composition of *Buthiscus* is “*Buthus* + *-iscus*”. Here, “-iscus” is a diminutive suffix. However, if literally translated as “小杀牛蝎”, it will cause conflict with *Butheolus*, which is also modified with a diminutive suffix. Since *Buthiscus* is reckoned to be of weak toxicity, it can then be freely translated as “弱杀牛蝎” as “弱” (weak) is a similar word to “小” in Chinese, while indicating its weak toxicity at the same time. Further, *Buthoscorpio* only means “a buthid-like scorpion” and is not the combination of *Buthus* and *Scorpio*, so it is translated as “似杀牛蝎”.

2.3 Toponym

2.3.1 If the genus is named after a single location, then the translation of the genus name will be the translation (in Chinese, usually transliteration) of this location. If there is an existing translation of the location, apply; if not, better transliterate it according to the local pronunciation. If the transliteration is too long in Chinese, translating it according to the meaning is acceptable.

E.g. *Auyantepuia* is translated as “魔屋山蝎”, while it will be too long to use the transliteration, “奥扬特普伊蝎”.

2.3.2 If the current translation of a location’s name is literal (according to its etymology) and one cannot tell whether it is a toponym, add a geographical modifier (such as “mount” and “island”) if there is none; a method which can also be applied when using transliteration. On the contrary, if the name already contains a geographic feature, then that part will be literally translated rather than transliterated.

E.g. *Superstitionia* was named after the Superstition Mountain which is literally translated as “迷信山” in Chinese, but not transliterated as “修珀斯蒂逊山”. The direct translation will merely be “迷信蝎” (“superstition scorpion”) as the genus name does not contain any geographic feature, so it should better be translated as “迷信山蝎”. Although *Karasbergia* was named after the Karasberg Hill, the word “berg” stands for “mount” already, so it will simply be translated as “卡拉斯山蝎” rather than the transliteration of “Karasberg”.

2.3.3 If the genus is a combination of a location name and a name of another genus, then the translation will be the combination of the translation of the location and the original genus. Additionally, if there is an accepted brief transliteration of the location, apply it in order to make the name concise.

E.g. *Himalayotityobuthus* will be translated as “喜山戾杀牛蝎” as “喜山” is the brief translation of “喜马拉雅山”. Further, *Vietbocap* is translated into “越南蝎”, but the genus name is a combination of *viet-* (Vietnam) and *bocap* (Vietnamese for “scorpion”), so it is not a single-location-type name, but a combination of toponym and autochthony.

2.3.4 If the toponym is not a geographical place, literally translate it according to the Chinese equivalence (which is transliteration in most of the time).

E.g. *Sassanidotus* was named after a dynasty (see above) and represents a paleonym, although it is a metonym after the type locality. The name is translated by the transliteration of the dynasty name as “萨珊蝎”. *Razianus* is simply transliterated

as “拉茲蝎” according to its etymology, Razi, although it is not a geographical location as well as the other ecodomonyms.

2.4 Eponym

2.4.1. If the genus is simply named after a modern person's name, then the translation will be in the form of “a transliteration of the first syllable + 氏 + 蝎”. The transliteration can follow the widely accepted one, or it is re-transliterated according to the certain pronunciation of that country.

E.g. *Polisius* is translated as “珀氏蝎” (after American arachnologist Gary Allan Polis).

2.4.2. If the genus is in a combination of a modern person's name with another genus, the person's name follows the previous rule and simply add the translation of the basic genus.

E.g. *Hoffmannihadrurus* is translated as “霍氏厚尾蝎” (after Mexican scorpionologist Carlos C. Hoffmann).

2.4.3. If a person's name is used many times for different genera, then the higher taxa where the genus belongs should be added for distinction.

E.g. *Vachonia* is of the same etymology as *Vachonus* (after French arachnologist Max Vachon). The former is translated into “瓦氏沟尾蝎” as it belongs to the family Bothriuridae (which is hereby translated as “沟尾蝎科”).

2.4.4. If the genus is named after a certain ethnic group of people, use transliteration or the already existing name for that group.

E.g. *Hottentotta* is translated as “霍屯督蝎”.

2.4.5. If the genus is named after a historical, mythological or fictional character, usually translate it according to the identity of that character.

E.g. *Belisarius* is translated as “将军蝎” as it is the name of a historical general. *Hadogenes* is translated as “冥神蝎” as it is the name of the god of the underworld in Greek mythology. *Vaejovis* is translated as “愈神蝎” as Vejovis was described as a god of healing. *Lychas* is translated as “信使蝎” as it was named after Hercules's herald. *Calchas* is translated as “祭司蝎” as it was named after a Greek priest. *Brotheas* is translated as “猎人蝎” as the character is described as a hunter. *Chaneke* was named after a natural spirit in folklore, so it is translated as “精灵蝎”. *Chactas* is translated as “蛮蝎” as the description for this character is “a noble savage” in the fictional novel.

2.4.6. If the identity is the same in two genera, use synonyms to distinguish.

E.g. *Pachakutej* is translated as “君主蝎” as it is the name of a sovereign. Similarly, *Teuthraustes*, *Zabius* and *Oiclus* were all named after kings, so they are respectively translated as “国王蝎”, “国君蝎” and “君王蝎” for distinction.

2.4.7. If the identity of a historical character is too strange to translate, transliterate the first two syllables (usually according to the Greek pronunciation of the name).

E.g. *Timogenes* is translated as “提玛蝎” as the identity of historian is too strange for a scorpion name. *Chaerilus* is translated as “寇里蝎” for the same reason.

2.4.8. If the identity of the mythological character is too strange or inappropriate to translate, translate it by the etymology of that character (this method can be also used for a historical character).

E.g. *Tityus* was named after a giant, but the general size of this genus is very small so it will be appropriate to translate it as “巨人蝎”. Also, it will be strange when this translation is applied in a closely related genus which is modified by the prefix *micro-* that means “small”. According to Tiniakos et al. (2010), name of *Tityus* is probably derived from the ancient Greek word “*tisis*”, meaning “he who suffers retribution”. A Chinese equivalence is “戾” which in some cases stands for “retribution”. As a result, the genus is translated as “戾蝎” and it does read smoothly in this way. The genus is not transliterated because that will be too long when applied in another derived names (e.g., *Himalayotityobuthus*). Additionally, one subgenus of this genus, *Atreus*, was named after the king of Mycenae (Atreus, Ἀτρεύς), so it is translated as “王戾蝎”. Similarly in the genus *Buthus*, according to Sousa et al. (2017), Leach did not offer an explanation for his choice of the genus name. However, they discussed the etymology of this genus in great detail and all the clues led to an unambiguous conclusion that *Buthus* is a name of a victorious athlete of the ancient Pythian Games, βοῦθος (*Bouthos*), who used to devour a great ox in a day. Several authors (Hofmann et al. (1698), Noël (1824), Müller (1848), Christesen (2007) and Dupré (2016)) also reached the same interpretation that this name literally means “sacrifice of an ox” (e.g., according to Dupré (2016), “Gr. *bous*, ox; - *thouéin*, killer”), an etymology formally adopted by Lowe et al. (2019) in their creation of a new genus, *Trypanothacus*. Therefore, the name *Buthus* could potentially refer to an animal which was considered so venomous that it could kill an ox at that time (the medically important type species, *Buthus occitanus* (Amoreux, 1789)). As such, the name *Buthus* should be translated as the “ox-killer scorpion”, which leads to the Chinese name, “杀牛蝎”. On the other hand, the name “钳蝎” would just be as weird as if one calls the *Homo sapiens* “手人” (hand human). Another hereby proposed translation is “竞蝎” (competitor scorpion), according to the identity of the person named βοῦθος (an athlete). However, since there is no proof that the person is the etymology of the genus *Buthus* (albeit the high likelihood), while Lowe et al. (2018) had already used “ox + sacrifice” as the etymology for *Trypanothacus*, a genus that contains the root “*buthus*”, I will just use “杀牛蝎” as the translation.

2.5 Bionym

This is rarely seen as the genus name and it is usually presented as “prefix + a basic genus”. The most common prefix is *troglo-*.

E.g. *Troglotityobuthus* is both a bionym (indicated by the prefix *troglo-*) and a taxon (*Tityobuthus* is a taxon), and it is translated as “穴戾杀牛蝎”. *Orobothriurus* is translated as “山沟尾蝎”. Autochthonyms and mythonyms that actually serve as bionyms like *Sotanochactas* and *Stygochactas* are translated as “深洞蛮蝎” and “冥河蛮蝎”, respectively.

2.6 Autochthony

2.6.1 If the genus is named in apposition with the equivalence of “scorpion” in another language, translate by the name of the language. If the language has a brief translation, use the brief one.

E.g. *Aemngvantom* is translated as “老挝蝎”; *Gint* is translated as “阿姆哈拉蝎”; *Jaguajir* is translated as “图皮蝎”; *Tehuankea* is translated as “阿拉乌咖那蝎”; *Kuarapu* is translated as “布雷佩查蝎”; *Kolotl* is simply translated as “纳瓦蝎” (“Nahuatl language” has a complete Chinese translation as “纳瓦特尔语”, but it can also be shortened as “纳瓦语”). *Alacran* is the “scorpion” in Spanish; however, it cannot be translated as “西班牙蝎” as it does not occur in Spain. The reason why it is name in a Spanish name is that people of Mexico where it is found speak Spanish. Thus, it should better be translated as “西语蝎”. *Akrav* is the “scorpion” in Biblical Hebrew and it will be briefly translated as “圣经蝎”.

2.6.2 If the autochthonym does not mean “scorpion”, freely translate it according to certain cases. **E.g.** *Konetontli* is not the “scorpion” in Nahuatl, but the “small creature”. Thus, the genus is translated as “微纳瓦蝎”.

2.6.3 If the autochthonym actually serves as a morphonym and so forth, translate it according to the rule of that type of name. **E.g.** As shown in *Rumikiru*.

2.7 Ergonym

As mentioned above, strictly speaking, there is only one example in scorpion genera, which is the *Trypanothacus*, a combination of the prefix *trypano-* that indicates the behaviour and the basic genus *Buthacus*. The prefix indicates that the scorpion digs burrow in more consolidated soil, which means it is a borrow-dwelling species. As a result, it is freely translated as “穴螯杀牛蝎” (*Buthacus* = *Buthus* + *-acus*, the suffix means “needle”, a reference to the long aculeus of the genus). As for the other names that indicates the habits and are categorized into this type of name, they are all literally translated; please refer to the Appendix.

3. Specific epithet

3.1 Morphonym

The translation for a morphonym of specific epithet is generally the same with that of a generic epithet. Likewise, if a literal translation is too simple and equivocal, use free translation only when there is an explanation in the original paper. Most of the morphological terminologies will be uniform unless the name does not read smoothly (depending on the tones and consonants).

E.g. The specific epithet of *Scorpio palmatus* is a combination of *palma* and *-atus* (literally means “with hand”), a reference to its wide chelal manus (in the scientific names, if a specific epithet means “with a specific body structure”, it usually indicates the pronounced development of that structure) and it is thus translated as “阔掌蝎”. *Liocheles oranghutan* was named as a pun. Orangutan (*oranghutan* in the Malay language) was found living in the same area with the scorpion. Also, the reddish brown color of the scorpion resembles that of the orangutan. Hence, it is translated as “猩红滑螯蝎”. The specific epithet of *Hemiscorpius falcifer* means “scythe bearing”, a reference to the sickle-shaped raptorial pedipalp fingers. It is thus freely translated as “镰指半蝎”. *Hemiscorpius flagelliraptor* was named in a combination of Latin nouns, “*flagellum*”, referring to the long,

whip-like metasoma, and “*raptor*” meaning a predator or robber. However, “predator” is somewhat redundant to modify a scorpion as all the scorpions are active predators. It is thus simply translated as “鞭尾半蝎”. *Broteochactas vestigialis* was named for vestigial characteristics that have the lateral keels and ventral half of caudal segment V. It is thus freely translated as “弱脊猎人蛮蝎”. The name of *Brachistosternus anandrovestigia* refers to the lack of metasomal glands, or androvestigia, on metasomal segment V. It is thus freely translated as “缺腺短胸蝎”. *Bothriurus ypsilon*, named after the Greek letter Y for the form of denticulation on caudal segment V. It is thus freely translated as “岔脊沟尾蝎” according to the shape of the letter. *Kraepelinia palpator* was named for its stout pedipalps. This is not implied in the specific epithet, but the translation will complement that meaning. It is thus translated as “壮肢克氏蝎”. The same case is in *Fetilinia dentator* which is constructed to rhyme with the former. The specific epithet refers to the prominently enlarged dentition on the metasoma. It is thus translated as “齿尾费氏蝎”. The specific epithet of *Hottentotta conspersus* means “sprinkled, moistened”, a reference to the black spots on its exoskeleton. It is thus freely translated as “喷斑霍屯督蝎”. *Hormurus penta* was named for five trichobothria on the ventral aspect of the pedipalp tibia (*penta* only stands for “five”). It is thus freely translated as “五孔链尾蝎”. The specific epithet of *Ananteris claviformis* merely means club-shaped, which refers to the stoutness of the bristles on the fourth and fifth metasomal segments, so it is thus freely translated as “强鬃无支蝎”.

The words *manus*, *cheles* and *chelys* (all refer to the pedipalp manus in scorpions) will be translated into “螯” or “掌” depending on situation (whether it reads smoothly). In Chinese Pinyin, “螯(áo)” is a rising tone (2nd tone) while “掌(zhǎng)” is a falling-rising tone (3rd tone). Phonologically, a phrase with two same tones will read smoothly (i.e., 2nd + 2nd, or 3rd + 3rd; however, in reality, the first word will turn into a 2nd tone in the second combination) and the translation in this combination should be given the priority. Moreover, a rising tone combines well with a falling tone (4th tone) with the latter before it (i.e., 4th + 2nd). It also sounds smoothly when two words of adjacent tones are combined together in the positive sequence (i.e., 2nd + 3rd) unless their consonants are the same (e.g., “zh-” + “zh-” has an awkward-sounding, but “ch-” + “zh-” will be better). Additionally, a “consonant + vowel” combination is better than a “consonant + consonant” combination. For example, *granimanus* is translated as “疣(yóu)螯(áo)” rather than “疣(yóu)掌(zhǎng)” (a “2nd + 2nd” example; the alternative is a “2nd + 3rd”, but it is a “consonant + consonant” combination), *leptochelys* is translated as “瘦(shòu)螯(áo)” rather than “瘦(shòu)掌(zhǎng)” (a “4th + 2nd” example), *crassimanus* is translated as “粗(cū)螯(áo)” rather than “粗(cū)掌(zhǎng)” (a “1st + 2nd” example) and *rectimanus* is translated as “直(zhí)螯(áo)” rather than “直(zhí)掌(zhǎng)” (a “2st + 2nd” example; the alternative is a “2nd + 3rd”, but does not read smoothly because they have the same consonant; however, both “长(cháng)螯(áo)” and “长(cháng)掌(zhǎng)” sounds well as the former is a “2nd + 2nd” form and the latter is a “2nd + 3rd” with different consonants).

3.2 Taxonym

In the case of a specific epithet, the taxonym is usually presented as a combination of “prefix/suffix + another taxon name / a specific epithet of another taxon”. The translation will maintain the translation for another taxon name / the specific epithet of another taxon. Adjectives that suggest resemblance, uncertainty and difference will be directly translated (explaining in detail may result in a very long name).

E.g. *Heteroscorpion opisthacanthoides* was named for its resemblance with the genus *Opisthacanthus* by adding the suffix *-oides*. The translation will only keep the translation of the genus itself, without adding “蝎” (strictly speaking, most of the scorpion genera names are not literally translated, but they are complemented by adding “蝎” in order to indicate the original name; exceptions are *Alpiscorpius*, *Euscorpius*, *Sardoscorpious*, *Hemiscorpious* and *Heteroscorpion*, who already have the word “scorpion” in their names). It is thus translated as “似后棘异蝎”. *Chaerilus pseudoconchiformus* was named for its resemblance with the species *Chaerilus conchiformus*. It is thus translated as “拟贝形寇里蝎”.

3.3 Toponym

3.3.1 The translation for a toponym in a specific epithet is generally the same with that of a genus name. If the species is named after a single location, then the translation of the specific epithet will be the transliteration of the location. If there is an existing translation of the location, apply; if not, better transliterate it according to the local pronunciation.

E.g. *Tityus sarisarinamensis* is simply translated as “萨里萨里尼亚马戾蝎” despite the length of the toponym (Tepui Sarisariñama).

3.3.2 If a current translation of a location’s name is literal (according to its etymology) and one cannot tell whether it is a toponym, add a geographical modifier (such as “mount” and “island”) if there is none; this method can also be applied when using transliteration. On the contrary, if a name already contains a geographic feature, then that part will be literally translated rather than transliterated.

E.g. *Hormurus boholiensis* is translated as “薄荷岛链尾蝎”. The toponym Bohol is transliterated as “薄荷” in China, which, however, will cause a confusion with the Chinese word for “mint”. As a result, the geographical modifier “岛” is added to eliminate confusion.

3.3.3 All the metonyms will be literally translated in order to be concise. This is according to the principle of concision and having no alteration of the meaning. Even if the name is equivocal, it does not always have to be complemented since the basic rule is to not to change the meaning. One will only have to add some further explanation as they introduce the species in the context of popularizing science.

E.g. Both *Kovarikia oxy* and *Tityus imei* were named after a college/institution, so they are simply translated as “西方学院寇氏蝎” and “医研所戾蝎”. However, *Tityus ivicnancor* was named after the abbreviation of an institution and the Latin word *nancor* (found). The translation will omit the “*nancor*” to avoid redundancy, so it will be “委内瑞拉科研所戾蝎”. Slightly differently, *Akrav israrachanani* was

named after both the type locality and its finder, so it will be completely translated as “以色列沙氏圣经蝎”. *Uroctonites sequoia* is translated as “红杉近尾戮蝎”, *Pseudouroctonus peccatum* as “罪恶拟尾戮蝎” and *Auyantepuia aurum* as “金矿奥扬特普伊蝎”. As for *Konetontli ignes*, the specific epithet is clearly a replacement of the type locality Fogos as both of them mean “fire”. The species name is thus translated after this type locality as “佛戈斯微纳瓦蝎”.

3.4 Eponym

3.4.1. If a species is simply named after a modern person, then translation is generally the same as for the genus name and will be in the form of “the transliteration of the first syllable + 氏”. The transliteration can follow the widely accepted one, or it is re-transliterated according to the certain pronunciation in that country. If the pronunciation of the first syllables are the same in the names of different people of congeneric species and there are not enough Chinese words to choose from, completely transliterate the species that with fewer syllables, or only transliterate the first two to three syllables for distinguishing. Additionally, if the popularity or importance of the species names that have the same pronunciation of the first syllable is unequal, give the priority of simplicity to the better or best known one (i.e., the transliteration of the first syllable + 氏). The current translation of every single scorpion species name in this naming method (an eponym after a modern person) has considered the likelihood of future conflict. All the *nomina dubia* are completely transliterated to give the priority of simplicity to the future certain taxa.

E.g. The syllables of *Tityus anneae* is fewer than that of *Tityus angelesae*. In order to be concise, the former is completely transliterated as “安妮氏戾蝎” while the latter is simply transliterated as “安氏戾蝎”. One special case is in *Scorpiops zubairahmedi* and *Scorpiops zubairi*, both of which were named after the same person (Zubair Ahmed, Pakistani arachnologist), so the latter one with fewer syllables is completely translated as “祖拜尔氏类蝎” (while the former as “祖氏类蝎”). *Androctonus amoreuxi* is translated as “阿氏杀人蝎” by the first syllable while *Androctonus aleksandrplotkini* is translated as “阿莱氏杀人蝎” by the first two syllables since the former is better known than the latter and is more frequently medically relevant, despite that the first syllable of both species has the same pronunciation.

3.4.2. If the specific name starts from the preposition or article of a person, translate it according to the first syllable of the surname of the person.

E.g. *Buthus delafuentei* was named after Félix Samuel Rodríguez de la Fuente and the species name starts from the particle “de”, so it will be translated as “弗氏杀牛蝎” by the first syllable of “Fuente”. Additionally, *Neochactas sanmartini*, which was named after the Uruguayan entomologist, Pablo R. San Martin, merely transliterating the first syllable will be unclear as “San” is a common part of the composite last name. It is thus translated as “圣马丁氏新蛮蝎”. For *Buthus jianxiniae*, which was named after the Chinese arachnologist, Jian-xin Qi (戚建新), Jian-xin is not her surname so it will be inappropriate to simply add “氏”.

So it can be either translated as “建新杀牛蝎” or “戚氏杀牛蝎”.

3.4.3. If a species is named after two persons' names, transliterate the first syllable of each.

E.g. *Chactas raymondhansi* was named after two collectors, Raymond A. Mendez and Hans E. A. Boos. It is thus translated as “瑞翰氏蛮蝎”. A similar case is the *Lisposoma joseehermana* which was named after the parents of the author, Marie-Josée and Herman Lamoral. It is thus translated as “休赫氏滑体蝎”.

3.4.4. If a species is named after a certain race of people, use transliteration or the already existed name for that race.

E.g. *Buthus nabataeus* is translated as “纳巴泰杀牛蝎”.

3.4.5. If a species is named after a fictional character, translate it according to the resemblance with that character, or complete transliteration is also acceptable as that does not alter the meaning.

E.g. *Centruroides rodolfoi* is freely translated as “欢愉似刺尾蝎”; *Vaejovis baggins* is freely translated as “侏儒愈神蝎”.

3.4.6. If a species is named after a historical or mythological character, translate it according to the identity of that character, or complete transliteration is also acceptable as that does not alter the meaning. If the identity is the same in two genera, use synonyms to distinguish.

E.g. Examples have all been listed in the previous text; for the translation, please refer to the Appendix.

3.4.7. For the special cases mentioned before (eponyms after a group of people or a symbolic entity, etc.), they are all literally translated (except for two cases).

E.g. *Euscorpius studentium* is literally translated as “学徒真蝎”; *Chactas oxfordi* is literally translated as “牛津蛮蝎”; *Mesobuthus brutus* is literally translated as “布鲁图斯中杀牛蝎”; *Vaejovis vaquero* is literally translated as “牛仔愈神蝎”; *Paravaejovis puritanus* is literally translated as “清教徒副愈神蝎”; *Bothriurus jesuita* is literally translated as “耶稣沟尾蝎”. *Neobuthus factorio* is freely translated as “米氏新杀牛蝎” by the name of the game creator. *Urophonius eugenicus* is translated as “主教尾弑蝎” according to the identity of that person.

3.5 Bionym

3.5.1 If the species is named after the type of its habitat or environmental conditions, literally translate it if the Latin meaning is clear for indicating the habitat. Words end in *-cola* will all be ended with “栖 (dwell)” in Chinese.

E.g. A special case is for *Diplocentrus actun* and *Diplocentrus cueva*, both of which were named after the word “cave”, just in different languages. The former is translated as “玛雅洞穴双棘蝎” to distinguish from the latter as the premodifier can also allude to its locality. The latter is simply translated as “洞穴双棘蝎” since Spanish is a widely spoken language and the scorpion does not occur in Spain.

3.5.2 If a bionym is shown as a metonym or using adjectives, use literal or free translation.

E.g. *Paruroctonus ventosus* is freely translated as “风地副尾戮蝎”; *Oiclus ardens* is freely translated as “热泉君

王蝎”; *Serradigitus calidus* is literally translated as “炎热锯指蝎”; *Serradigitus torridus* is freely translated as “灼热锯指蝎”; *Kochius colluvius* is literally translated as “崩积科氏蝎”; *Microtityus vulcanicus* is literally translated as “火山土微戾蝎”; *Tityus rupestris* is literally translated as “石栖戾蝎”.

3.6 Autochthony

3.6.1 The translation for an autochthony of specific epithet is generally the same with that of the generic epithet. If the species is named in apposition with the equivalence of “scorpion” in another language, translate by the name of the language. If the language has a brief translation, use the brief one.

E.g. *Pandinurus hangarale* is translated as “索马里尾惧蝎”; *Pandiborellius igdu* is translated as “阿法尔博氏惧蝎”; *Parabuthus kajibu* is translated as “奥罗米亚副杀牛蝎”; *Tityus kukututee* is translated as “恩迪乌卡戾蝎”; *Hottentotta vinchu* is translated as “马拉提霍屯督蝎”.

3.6.2 If a name of the language may cause confusion, add the word “语” (similar to the case of *Alacran*).

E.g. *Troglorhopalurus lacrau* is translated as “葡语穴棍尾蝎” as the scorpion does not occur in Portugal. *Diplocentrus sinaan* is translated as “玛语双棘蝎” instead of “玛雅双棘蝎” because of an existing species, *Diplocentrus maya* Francke, 1977. Similarly, *Ananteris sipilili* is translated as “卡里那语无支蝎” to avoid conflict with *Ananteris kalina* Ythier, 2018 whose specific epithet is the language origin of that of the former.

3.6.3 If the autochthony does not mean “scorpion”, freely translate it according to certain cases.

E.g. *Vaejovis pequeno* is Spanish for “the little one”, thus translated as “娇小愈神蝎”.

3.6.4 If an autochthony actually serves as a morphonym, etc., translate it according to the rule of that type of name.

E.g. *Tityus dedoslargos* is Spanish for “long fingers” and literally translated as “长指戾蝎”. *Brachistosternus kamanchaca* is freely translated as “海岸短胸蝎”. *Brachistosternus quiscapata* is literally translated as “棘丛短胸蝎”. *Brachistosternus ninapo* is literally translated as “火山短胸蝎”.

3.6.5 If an autochthony is a metonym after the type locality or morphology, use literal translation to avoid (maybe future) conflicts.

E.g. *Diplocentrus oxlajujbaktun* was named after the Mayan calendar to allude to its type locality. However, it cannot be translated as “玛雅双棘蝎” as it causes a conflict with the translation of *Diplocentrus maya*. Consequently, it is literally translated as “历法双棘蝎”. *Thorellius yuyuawi* is literally translated as “黑黍托氏蝎” to avoid a conflict with a potential species named “*Thorellius atrolaevigatus*”.

3.6.6 Linguonyms will be directly translated according to the Chinese names of those languages.

E.g. *Parabuthus kuanyamarum* is translated as “宽亚玛副杀牛蝎”.

3.7 Ergonym

All the names that indicate behavior of the species are

literally translated; please refer to the Appendix. Some of the names are named after human identities with the suffix *-tor* forming agent nouns. Most of them will be literally translated with an end of “者” instead of “人” to reduce their association with humans since the former is more widely used as it can be seen in the Chinese equivalence of “predator” (捕食者), which can be used to describe the ecological niche of an animal. Some identities in Chinese do not end with “人” and they will be adopted directly.

E.g. imperator, dictator, fossor, praedo, viatoris and *piscatorius* are translated as “统治者”, “独裁者”, “掘洞者”, “掠夺者”, “旅行者” and “捕鱼者”, respectively (although the last species is not reckoned to be able to catch fish), while *pugilator* is translated as “拳击手”.

For other ergonyms, such as *Uroctonus mordax* (both the genus and species names are ergonyms), please refer to the Appendix.

3.8 Tautonym

All the cases are listed in the previous text and all of them are the type species of their genus. As a result, since the Chinese term for type species is “模式种”, the specific epithet will be replaced by “模式” to avoid repetition and indicate their taxonomic status.

E.g. For the translation, please refer to the Appendix.

3.9 “Ordonym”

All the species that are included in this special case are listed in the previous text and all of them will be transliterated according to the current Chinese names for the Greek letters. Moreover, axonyms will all be literally translated.

E.g. For the translation, please refer to the Appendix.

4.0 Problematic cases

Fortunately, there are not many names that are etymologically unclear in scorpions, but such cases still exist. To begin with, *Babycurus* Karsch, 1886 was not given an etymology by the author. However, it might be a combination of *babyc-* and *-urus*. The prefix is unknown but the suffix is commonly seen, and means “tail”. Luckily, this genus has a junior synonym, *Rhoptrurus* Karsch, 1886, which can be literally translated as “club-tailed scorpion”. The two synonyms have one word in common. As a result, the senior synonym is translated by its junior synonym as “棒尾蝎”. Hence, if a genus is of unknown etymology and it has a junior synonym which is translatable, use the translation of the junior synonym. If it has multiple junior synonyms, give the priority to the earliest one. If the earliest one is not translatable, use the second, and so on. If all the synonyms are not translatable, then consider transliteration or create a new name, or use the autochthonym, if it exists.

According to Dupré (2016), *Charmus* Karsch, 1879 was named after the ancient Indian people, Charmae. It seems that Charmae is a plural form of Charma, an ancient character in Hindu mythology, who is a son of Shraddhadeva Manu, the ancestor of mankind. This name has also occurred in the book *The history of initiation, in twelve lectures: comprising detailed account of the rites and ceremonies, doctrines and discipline of all the secret and mysterious institutions of the*

ancient world by Oliver (1782-1867). However, the type species of this genus is *C. laneus* Karsch, 1879. As it can be seen from the complete scientific name that, the type species was instantly designated when the genus was established. The type locality is Ceylon (now Sri Lanka) (Kovařík et al., 2016), which has never been a part of India, so Charma is not justified. Hence, the name is currently considered to be derived from Medieval English *charme*, from Latin *carmen*, which means “magical spell”. The English word “charm” is of the same origin. This may be cognate with the Greek word χάρμα (khárma) that means joy or delight. Thus the name is temporarily translated as “迷蝎” (the “charming/mysterious scorpion”) and also as a pun to allude to its mysterious etymology.

Also according to Dupré (2016), *Groshus* Simon, 1880 was named after a character in the *Odes* by Horace. The character Groshus was described as a wealthy Sicilian landlord. This is very much possible as Simon had named several genera after literary characters. However, I have looked into the original paper and the etymology was not given, so it is only a speculation. The word “groshus” comes from ancient Greek γρόσφος (grósphos) which means the “point of a javelin”. Similar with *Tityus* and *Buthus*, many ancient Greek characters’ names are derived from certain words. For example, Aeneas is the Romanization of the hero’s original Greek name Αίνεας (Aineás). Aineás is first introduced in the *Homeric Hymn to Aphrodite* when Aphrodite gives him a name from the adjective αἰνός (ainón, “terrible”), for the “terrible grief” (αἰνός ἄχος) he has caused her by being born as a mortal who will age and die (Nagy, 2001). As a result, *Groshus* is currently translated as “矛蝎” (the spear scorpion) after the etymology of the person’s name.

Akin to *Babycurus*, the etymology of *Thestylus* Simon, 1880 was not given. It might be a Greek character name since it was named by Simon, but no such name was found. The word *stylus* means “a stake or pale” in Latin, from ancient Greek στῦλος (stûlos, “a pillar”). The junior synonym of this genus is *Maecocentrus* Karsch, 1880 whose prefix *maeco-* is of an unknown origin and *centrus* means “sharp point”. The word *centrus* is from Latin *centrum*, from ancient Greek κέντρον (kéntron), from κεντεῖν (kenteín, “to prick, goad”), which is also the etymology of the English word “center”. Apparently, *stylus* and *centrus* are of similar meaning. As a result, the genus named is currently partially translated as “尖刺蝎” (the spike scorpion).

Finally, in one species, although the etymology of *Teuthraustes carmelinae* Scorza, 1954 is unknown, it is temporarily considered as a female name and translated as “卡氏国王蝎”.

Conclusions

The scientific Latin name is the only exclusive name for an animal while the binomial nomenclature is the regulation for how a scientific name should be coined. The etymology of

the scientific names is rather diverse. Although one scientific name may not be “correct” (mostly due to the lack of knowledge at that time) and sometimes it may be arbitrary or inconclusive, it represents the view of the original author and what is reckoned in the current classification for most of the time. The Latin name can be misleading by its meaning, yet it acts as the “identity card” of a species so usually no academic confusion or complexity (unlike in other various names for an animal) will occur.

Animal names are more diverse in China than in other countries as there are “formal” names aside from the folk/vernacular names. So how should one consider the question “what is the name of this animal”? All the names above can be considered as the names of one species (folk names, vernacular names or formal names, etc.); however, they must be ranked with priority (in this paper: scientific Latin names > translation (equivalent) of the scientific names (when one does not use Latin) > formal names (of academic value and only in China) > folk names (of cultural value) > vernacular names (the most casual one)). Science popularization of zoology is rather ubiquitous in the Chinese society today. Yet, most of the science communicators fail to emphasize the importance of knowing the scientific names of the animals they address either because of the difficulty of memorizing Latin names (for both the communicators and their audience), or lack of knowledge of basic science (or the importance of the scientific names is not reinforced in their cognition), or reluctance to use Latin name (due to hypocritical “cultural confidence” or radical bias against all foreign cultures). As a result, many do not provide Latin names; they may use various names (including the formal Chinese names), which leads to the confusion among the target audience. They have no clear knowledge of the types of animal names, so they usually do not explain what kind of the name they use. Even if they provide the audience with a scientific name, the audience may think that the Chinese name is the equivalent to it. However, this is only justified if the Chinese name is a translation of the Latin name, yet, more often it is not. Consequently, people argue about the correctness of those various names and they never realize that those are not “linguistically Chinese versions of the Latin names”, or they do not know that Latin names are the only valid names for animals in biology.

Being a minority field with little attention in China, the Chinese name of scorpion inevitably exhibits a high level of confusion. The knowledge of scorpion species is mainly induced by the Chinese scientific publications and the amateur circles. The names used in both cases are filled with inconsistency and confusion. Leaving aside vernacular names, the names used in the scientific field should be standardized; yet just like for all the other animal taxa, they so far failed to achieve this in scorpiology.

The present contribution provided the first detailed introduction to the scorpion scientific names by thoroughly investigating their categories, along with Chinese names for all the extant, valid species proposed by using the

method of translating Latin names according to their etymology in a systematic fashion. In the beginning, this article has also discussed at length the current confusion and chaos in Chinese scorpion names. Since most people in China are neither familiar with nor good at Latin names, standards of formally naming Chinese names for animals should be established. The current formal Chinese names may come from folk names, vernacular names, translation of Latin names, and translation of common names used in foreign countries. Self-created names frequently appear as well. Such phenomenon is also found for many other taxa; it is reasonable to believe that this is a common problem. Moreover, current Chinese translations of Latin names further fall into three groups: incomplete, inappropriate, and inconsiderate translation. All these different kinds of names have complicated the identity of certain species, which, I believe, causes confusion in public cognition and amateur study. However, at least those previous authors had tried to translate the Latin names and only some refinement is needed.

I am not saying that one must only give a Chinese name to an animal by translating the Latin names; nevertheless, this proved to be the most orderly and coherent way, and it has also been performed in several other taxa (by my personal trials) with most of the translating rules being feasible as well (of course, one can easily coin a scientific name that would be hard to translate, or the translation would conflict with the existing one if they object to the principle of translating Latin names to respect the original meaning). More importantly, many of the names that I translated are being accepted and used by more and more people. Besides scorpions, one of the most widely used Chinese names among amateurs translated by me in Mantodea Latreille, 1802 is “中敛绞螳” for *Pnignomantis medioconstricta* Westwood, 1889. However, many names like “斧螳” (ax mantis; for *Hierodula* Burmeister, 1838) and “刀螳” (knife mantis; for *Tenodera* Burmeister, 1838) originated from common name “刀螂” (a folk name for all the common mantis species), while *Machairima* Beier, 1965 is the genus that deserves the name “刀螳” (etymology: *mákhaira* or *machairi*, a large knife). One of the excuses commonly used by the protesters against translating Latin names according to their etymologies is the theory of cognition. They believe that if one name has been used for a long time and both the public and scientists have already become familiar with it, the name should not be replaced. However, my personal trials and observations in people’s application of the Chinese names of scorpions have demonstrated that, although such novelty will certainly cause conflicts, it will only be temporary since the old usage will vanish while new people will continuously emerge who use the new name. If those new people are introduced to the new names in the first place, with the increase of their number, the old confusing names will go extinct eventually (nevertheless, folk names do not have to perish as they represent the culture of certain regions). However, if no action is taken, the current condition will only become worse as there will be more species recognized

by both the professionals and the public with the previous naming methods, thus leading to further difficulties and chaos in Chinese names for animals. Habit should never be an excuse of rejecting novelty. Many people who are against of designating the Chinese names in a more systemized way with etymological supports claim that creating new names will only cause chaos and it is neither necessary or beneficial for communication. However, I personally believe that a Chinese name does not have to be permanently invariant, because taxonomy constantly changes, and one should update the name in order to be consistent with the current study for a better cognition. Certainly, an experienced researcher does not have such a need, but creation of a Chinese name itself serves the purpose of helping those who are unfamiliar with Latin names, which includes new hobbyists. Those new hobbyists will be confused by the old names and the contradictory taxonomy. Without question, there will be people who may ask “why not update a Chinese name?” They will certainly be suppressed in the current ideological environment as the previous hobbyist/researchers have already got used to their comfort zones of using those old names. Apparently, this matter is totally subjective, while I believe that refining the names is essential and avoiding making changes is merely an excuse for laziness (or just due to the utter indifference, which gives one no right to interfere with others’ choice).

Translating Latin names according to the etymologies is rather routine in the field of palaeontology albeit many people object to this method in the studies of extant taxa. If one insists on naming animals in Chinese by not using translation (or partially), they ought to organize a standardized regulation in order to reduce chaos. However, absence of a nationally accepted formal Chinese nomenclature for animals is why the chaos keeps appearing. Without regulation, there will be chaos. On the contrary, this is exactly why the binominal nomenclature is still followed by all the scientists worldwide: a well-established regulation prevents almost all of the potential confusion. The protesters of translating Latin names assert that it is not necessary to name animals in Chinese according to the etymology of Latin names. But who defines the necessity? There is no rule, and such definition is completely subjective. Designation of formal Chinese names is for the convenience of Chinese to know animals. However, many cannot deliver a clear and systematic picture to those who want to know more. Designation of Chinese names should not only concern the ordinary public which is given chaotic although vulgar names, but also those who want to study them as well as those who are interested in etymology and translation. Despite the fact that some people in China oppose and taunt the ideology of designating Chinese names for animals by the etymology of their scientific names, none of them has ever endeavored to provide a systemized regulation of naming animals in Chinese or a complete list of Chinese names for a certain taxon. On the other hand, true scorpions in China consider this matter much more rationally as they admit previous mistakes in the existing formal Chinese names for scorpions.

The present contribution is not to gain acceptance or replace all the names, because this matter is utterly conceptual and subjective; instead, this acts as an evidence for the feasibility and superiority of designating Chinese names according to the etymologies. Inevitably, more obstacles may occur when trying to translate other taxa, however, this contribution also serves as an example. There is no right or wrong in choosing which name to use. Yet, I tend to provide an alternative perspective for those beginners who may not have a clear cognition of the types of various names. No one should be dictated by the so-called “trend” (i.e., for the Chinese animal names, use Chinese formal names only), but they deserve the opportunity to think critically. All the beginners and those who start to have a inclination of translating Latin names should be offered help; if everyone else is trying to force the beginners to use the Chinese formal names only because they feel comfortable with it and intend to have the complete control over those beginners, then I shall be the one to show them another path. The Chinese names for animals are not as formal as scientific names, no one should be asked to use a certain type of name, and everyone has the right to propose a more orderly naming system, as long as they prove its feasibility. Asserting different principles and performing the corresponding measures in choosing which type of names to use (a casual and subjective context) is just like applying different phylogenetic hypotheses (a much more serious context). Conflicts and modifications will constantly exist in all aspects of human history.

Acknowledgements

I thank Professor Victor Fet for his help. I also show my greatest thankfulness to Professor Fet for being given a chance to publish this study; such a long article without academic content is hard to publish in China, although this article is precisely aimed at the Chinese readers.

In addition, I would like to express my great gratitude to the French scorpions Gérard Dupré, who has published the first dictionary of scientific scorpion names and solved most of my translation troubles.

Then, my gratefulness also goes to the Norwegian scorpions Jan Ove Rein, who established the website of *Scorpion Files* which became the portal into scorpion world for numerous amateurs in scorpions (including myself) and provided the most convenient channel to get to know the basic scorpion classification (and also the foundation of the Appendix in the present contribution).

Besides, I would like to thank Zhiyong Di for admitting my efforts of translation, as well as the objective admission of the problem in the contradictory formal Chinese names.

Moreover, I also appreciate the help of two anonymous reviewers in refining this paper.

Finally, I extend my respect to all scorpion researchers. It is the joint effort of everyone that makes the study of scorpions reach this far.

Appendix 1

Chinese scorpion names checklist

Note: The list below does not include any superfamilies, subfamilies, tribes, subtribes, subgenera, or species-groups/complexes. Currently recognized subgenera (with Chinese translations) and a classification of supraspecific taxa based on current consensus are given in the end.

蝎目 Order **Scorpiones** C. L. Koch, 1837

新蝎亚目 Suborder **Neoscorpionina** Thorell & Lindström, 1885

直胸下目 Infraorder **Orthosternina** Pocock, 1911

杀牛蝎小目 Parvorder **Buthida** Soleglad & Fet, 2003

杀牛蝎科 Family **Buthidae** C. L. Koch, 1837

爱琴杀牛蝎属 Genus **Aegaeobuthus** Kovařík, 2019 [*aegaeo-* (Aegean) + *Buthus*]^{to&ta}

塞浦路斯爱琴杀牛蝎 *Aegaeobuthus cypricus* (Gantenbein & Kropf, 2000) [Cyprus]^{to}

伽氏爱琴杀牛蝎 *Aegaeobuthus gallianoi* (Ythier, 2018) [Raymond Galliano]^{ep}

隆背爱琴杀牛蝎 *Aegaeobuthus gibbosus* (Brullé, 1832) [hunch-backed (*gibbus* (gibbous) + -*osus* (full of, overly))]^{mo}

黑环爱琴杀牛蝎 *Aegaeobuthus nigrocinctus* (Ehrenberg, 1828) [*nigro-* (black) + *cinctus* (banded)]^{chr}

非洲等蝎属 Genus **Afroisometrus** Kovařík, 1997 [*afro-* (African) + *Isometrus*]^{to&ta}

敏氏非洲等蝎 *Afroisometrus minshullae* (Fitzpatrick, 1994) [Jacqueline Minshull]^{ep}

非洲信使蝎属 Genus **Afrolychas** Kovařík, 2019 [*afro-* (African) + *Lychas*]^{to&ta}

布氏非洲信使蝎 *Afrolychas braueri* (Kraepelin, 1886) [August Brauer]^{ep}

伯氏非洲信使蝎 *Afrolychas burdoi* (Simon, 1882) [Adolphe Burdo]^{ep}

无刺杀牛蝎属 Genus **Akentrobuthus** Lamoral, 1976 [*a-* (without) + *kentro-* (here as “spur”) + *Buthus*]^{mod&ta}

阿塔科拉无刺杀牛蝎 *Akentrobuthus atakora* Vignoli & Prendini, 2008 [Range of Atakora, Benin]^{to}

雷氏无刺杀牛蝎 *Akentrobuthus leleupi* Lamoral, 1976 [Narcisse Leleup]^{ep}

阿氏戾蝎属 Genus **Alayotityus** Armas, 1973 [Pastor Alayo Dalmau + *Tityus*]^{ep&ta}

克氏阿氏戾蝎 *Alayotityus delacruzi* Armas, 1973 [Jorge de la Cruz]^{ep}

费氏阿氏戾蝎 *Alayotityus feti* Teruel, 2004 [Victor Fet]^{ep}

格拉玛阿氏戾蝎 *Alayotityus granma* Armas, 1984 [Granma Province, Cuba]^{to}

胡拉瓜阿氏戾蝎 *Alayotityus juraguaensis* Armas, 1973 [Playa Juraguá, Oriente Province, Cuba]^{to}

石栖阿氏戾蝎 *Alayotityus lapidicola* Teruel, 2002 [*lapidi-* (stone) + -*cola* (dweller)]^{bi}

侏儒阿氏戾蝎 *Alayotityus nanus* Armas, 1973 [dwarf]^{mo}

淡色阿氏戾蝎 *Alayotityus pallidus* Teruel, 2002 [*pall-* (pale) + -*idus* (tending to)]^{chr}

马埃斯特腊山阿氏戾蝎 *Alayotityus sierramaestrae* Armas, 1973 [Maestra Mts., Cuba]^{to}

无支蝎属 Genus **Ananteris** Thorell, 1891 [*an-* (without) + *anteris* (here as “fulcra”)]^{mo}

阿氏无支蝎 *Ananteris arcadioi* Botero-Trujillo, 2008 [Arcadio Botero]^{pa}

阿沙宁卡无支蝎 *Ananteris ashaninka* Kovařík, Teruel, Lowe & Friedrich, 2015 [Asháninka, people of Amazonian Peru]^{et}

艾氏无支蝎 *Ananteris ashmolei* Lourenço, 1981 [Nelson Philip Ashmole]^{ep}

亚松森无支蝎 *Ananteris asuncionensis* González-Sponga, 2006 [La Asunción, a city in Venezuela]^{to}

巴氏无支蝎 *Ananteris balzani* Thorell, 1891 [Luigi Balzan]^{ep}

巴里纳斯无支蝎 *Ananteris barinensis* González-Sponga, 2006 [Barinas State, Venezuela]^{to}

伯氏无支蝎 *Ananteris bernabei* Giupponi, Vasconcelos & Lourenço, 2009 [Tiago Nascimento Bernabé]^{ep}

彼氏无支蝎 *Ananteris bianchini* Lourenço, Aguiar-Neto & Limeira-de-Oliveira, 2009 [Mario Luciano Bianchini]^{ep}

绚丽无支蝎 *Ananteris bonito* Lourenço, 2012 [Spanish for “beautiful”]^{au(mo)}

卡欣布无支蝎 *Ananteris cachimboensis* Lourenço, Motta & da Silva, 2006 [Serra do Cachimbo, Pará State, Brazil]^{to}

卡玛坎无支蝎 *Ananteris camacan* Lourenço, Giupponi & Leguin 2013 [Camacan Municipality, Bahia State, Brazil]^{to}

巴拿马无支蝎 *Ananteris canalera* Miranda & Armas, 2020 [refers to the inhabitants of Panama]^{et}

卡雅布无支蝎 *Ananteris capayaensis* González-Sponga, 2006 [Capaya, a town in Miranda State, Venezuela]^{to}

加拉加斯无支蝎 *Ananteris caracensis* González-Sponga, 2006 [Caracas, a city in Venezuela]^{to}

卡拉斯科无支蝎 *Ananteris carrasco* Lourenço & Motta, 2019 [a topographic name in Spanish, from Latin *cerrus* (pine tree)]^{au(to)}

科迈罗无支蝎 *Ananteris catuaro* González-Sponga, 2006 [Catuaro, a village in Sucre State, Venezuela]^{to}

高加圭塔无支蝎 *Ananteris caucaguitensis* González-Sponga, 2006 [Caucagüita suburb, Miranda State, Venezuela]^{to}

恰氏无支蝎 *Ananteris chagasi* Giupponi, Vasconcelos & Lourenço, 2009 [Amazonas Chagas Júnior]^{ep}

查氏无支蝎 *Ananteris charlescor* ieldi Lourenço, 2001 [Charles Corfield]^{ep}

奇里马克无支蝎 *Ananteris chirimakei* González-Sponga, 2006 [Quebrada Chirimak, Bolívar State, Venezuela]^{to}

安第斯无支蝎 *Ananteris cisandinus* Lourenço, 2015 [*cis-* (on the same side) + *andinus* (Andes)]^{to}

- 强鬃无支蝎 *Ananteris claviformis* González-Sponga, 2006 [*clavi-* (club) + *formis* (form)]^{mo}
 柯氏无支蝎 *Ananteris coineaui* Lourenço, 1982 [Yves Coineau]^{ep}
 哥伦比亚无支蝎 *Ananteris columbiana* Lourenço, 1991 [Colombia]^{lo}
 隐居无支蝎 *Ananteris cryptozoicus* Lourenço, 2005 [*crypto-* (hidden) + *-zoic* (life)]^{bi}
 康比无支蝎 *Ananteris cumbensis* González-Sponga, 2006 [“Cumbe”, refers to a region in Venezuela during the colonial period]^{pal}
 库拉里无支蝎 *Ananteris curariensis* González-Sponga, 2006 [Curari, Falcón State, Venezuela]^{lo}
 鄂氏无支蝎 *Ananteris cussinii* Borelli, 1910 [Alfredo Cussini]^{ep}
 达氏无支蝎 *Ananteris dacostai* Ythier, Chevalier & Lourenço, 2020 [José Da Costa]^{ep}
 德氏无支蝎 *Ananteris dekeyseri* Lourenço, 1982 [Pierre Louis Dekeyser]^{ep}
 僧氏无支蝎 *Ananteris deniseae* Lourenço, 1997 [Denise V. Tambourgy]^{ep}
 德西德里奥无支蝎 *Ananteris desiderio* Lourenço, Giupponi & Leguin 2013 [São Desidério Municipality, Bahia State, Brazil]^{lo}
 迪氏无支蝎 *Ananteris diegorojasi* Rojas-Runjaic, 2005 [Diego Francisco Rojas-Runjaic]^{ep}
 多氏无支蝎 *Ananteris dorae* Botero-Trujillo, 2008 [Dora Elizabeth Mendoza]^{ep}
 埃氏无支蝎 *Ananteris ehrlichi* Lourenço, 1994 [Paul Ralph Ehrlich]^{ep}
 埃尔瓜波无支蝎 *Ananteris elguapoi* González-Sponga, 2006 [El Guapo, Miranda State, Venezuela]^{lo}
 伊氏无支蝎 *Ananteris elisabethae* Lourenço, 2003 [Elisabeth Nogueira Ferroni Schwartz]^{ep}
 爱氏无支蝎 *Ananteris evelynae* Lourenço, 2004 [Évellyn Christinne Bruchmüller Ramos]^{ep}
 茵氏无支蝎 *Ananteris faguasi* Botero-Trujillo, 2009 [Giovanny Fagua]^{ep}
 菲氏无支蝎 *Ananteris festae* Borelli, 1899 [Enrico Festa]^{ep}
 弗氏无支蝎 *Ananteris franckeai* Lourenço, 1982 [Oscar Federico Francke Ballvé]^{ep}
 戈尔戈纳无支蝎 *Ananteris gorgonae* Lourenço & Flórez, 1989 [Gorgona Island, Colombia]^{lo}
 圭里帕无支蝎 *Ananteris guiripaensis* González-Sponga, 2006 [Guiripa, a town in Aragua State, Venezuela]^{lo}
 圭亚那无支蝎 *Ananteris guyanensis* Lourenço & Monod, 1999 [French Guiana]^{lo}
 黑褐无支蝎 *Ananteris infuscata* Lourenço, Giupponi & Leguin, 2013 [obscured, perfect passive participle of *infusco* (darken)]^{chr}
 因氏无支蝎 *Ananteris inoae* González-Sponga, 2006 [Inocencia Delgado, abbreviated first name]^{ep}
 中介无支蝎 *Ananteris intermedia* Lourenço, 2012 [*inter-* (between) + *media* (middle)]^{ta}
 卡里那无支蝎 *Ananteris kalina* Ythier, 2018 [Kali’na, ethnic group of Mana, French Guiana]^{et}
 库氏无支蝎 *Ananteris kuryi* Giupponi, Vasconcelos & Lourenço, 2009 [Adriano Brilhante Kury]^{ep}
 雷氏无支蝎 *Ananteris leilae* Lourenço, 1999 [Leila Aparecida Souza Kury]^{ep}
 卢氏无支蝎 *Ananteris luciae* Lourenço, 1984 [Lucia H. Rapp Py-Daniel]^{ep}
 马德拉无支蝎 *Ananteris madeirensis* Lourenço & Duhem, 2010 [Madeira River]^{lo}
 马米利班无支蝎 *Ananteris mamilihpan* Ythier, Chevalier & Lourenço, 2020 [Mamilihpan Inselberg, French Guiana]^{lo}
 马尼亞普爾无支蝎 *Ananteris maniapurensis* González-Sponga, 2006 [Maniapure River, Bolívar State, Venezuela]^{lo}
 马拉尼昂无支蝎 *Ananteris maranhensis* Lourenço, 1987 [Maranhão State, Brazil]^{lo}
 玛氏无支蝎 *Ananteris mariaelenae* Lourenço, 1999 [Maria Elena de Lima Perez Garcia]^{ep}
 瑪氏无支蝎 *Ananteris mariaterezae* Lourenço, 1987 [Maria Tereza Jorge Padua]^{ep}
 马氏无支蝎 *Ananteris martensi* Lourenço, 2021 [Jochen Martens]^{ep}
 毛氏无支蝎 *Ananteris mauryi* Lourenço, 1982 [Emilio Antonio Maury]^{ep}
 梅里达无支蝎 *Ananteris meridana* González-Sponga, 2006 [Mérida Municipality, Venezuela]^{lo}
 迈氏无支蝎 *Ananteris michaelae* Lourenço, 2013 [Michael W. Webber]^{ep}
 弥氏无支蝎 *Ananteris myriamae* Botero-Trujillo, 2007 [Myriam Trujillo]^{ma}
 奈氏无支蝎 *Ananteris nairae* Lourenço, 2004 [Nair Otaviano Aguiar]^{ep}
 娜氏无支蝎 *Ananteris norae* González-Sponga, 2006 [Nora Ferstadt]^{ep}
 黯色无支蝎 *Ananteris obscura* Lourenço & Motta, 2021 [dark]^{chr}
 欧氏无支蝎 *Ananteris ochoai* Botero-Trujillo & Flórez, 2011 [José Antonio Ochoa]^{ep}
 奥氏无支蝎 *Ananteris otaviano* Lira, Pordeus & Ribeiro de Albuquerque, 2017 [Otaviano Pereira de Araújo]^{ep}
 帕尔马里无支蝎 *Ananteris palmari* Botero-Trujillo & Noriega, 2011 [Palmari Natural Reserve, Brazilian Amazonia, Brazil]^{lo}
 埃尔堡无支蝎 *Ananteris paoensis* González-Sponga, 2006 [El Pao, Bolívar State, Venezuela]^{lo}
 帕拉考托无支蝎 *Ananteris paracotoensis* González-Sponga, 2006 [Paracotos, a town in Miranda State, Venezuela]^{lo}
 皮氏无支蝎 *Ananteris pierrekondre* Lourenço, Chevalier, Gangadin & Ythier, 2020 [Pierre Kondre, a town in Para District, Suriname]^{ep}
 普拉塔无支蝎 *Ananteris plataensis* González-Sponga, 2006 [Caño La Plata, a tributary of Guaniamo River, Bolívar State, Venezuela]^{lo}
 菩氏无支蝎 *Ananteris platnicki* Lourenço, 1993 [Norman Ira Platnick]^{ep}
 敦氏无支蝎 *Ananteris polleti* Lourenço, 2016 [Marc Pollet]^{ep}
 首要无支蝎 *Ananteris principalis* González-Sponga, 2006 [important (the most numerous species in number in this region)]^{ax}
 匹氏无支蝎 *Ananteris pydanieli* Lourenço, 1982 [Victor Py-Daniel]^{ep}
 考拉河无支蝎 *Ananteris riocurensis* González-Sponga, 2006 [Caura River, Bolívar State, Venezuela]^{lo}
 奇科河无支蝎 *Ananteris riochicoi* González-Sponga, 2006 [Chico River, Miranda State, Venezuela]^{lo}

- 马埃河无支蝎 *Ananteris riomachensis* Rojas-Runjaic, Portillo-Quintero & Borges, 2008 [Maché River, Venezuela]^{lo}
 罗赖马无支蝎 *Ananteris roraima* Lourenço & Duhem, 2010 [Mt. Roraima, the Guianas region, South America]^{lo}
 萨氏无支蝎 *Ananteris sabineae* Lourenço, 2001 [Sabine Jourdan]^{ep}
 珊氏无支蝎 *Ananteris sanchezi* González-Sponga, 2006 [Julio C. Sánchez]^{ep}
 瑟氏无支蝎 *Ananteris sepulvedai* González-Sponga, 2006 [Sigifrido Sepúlveda]^{ep}
 独特无支蝎 *Ananteris singularis* González-Sponga, 2006 [unique, refers to its unique lateroventral carinae of metasoma V)]^{mo}
 卡里那语无支蝎 *Ananteris sipilili* Ythier, Chevalier & Lourenço, 2020 [Kali'na language for "scorpion"]^{au}
 琥氏无支蝎 *Ananteris solimariae* Botero-Trujillo & Flórez, 2011 [Solimary Garcia]^{ep}
 苏里南无支蝎 *Ananteris surinamensis* Lourenço, 2012 [Suriname]^{lo}
 特氏无支蝎 *Ananteris terueli* Kovařík, 2006 [Rolando Teruel Ochoa]^{ep}
 托利马无支蝎 *Ananteris tolimana* Teruel & Garcia, 2007 [Tolima Department, Colombia]^{lo}
 特里索无支蝎 *Ananteris tresor* Ythier, Chevalier & Lourenço, 2020 [Trésor Regional Natural Reserve, Mt. Kaw, French Guiana]^{lo}
 图伦班无支蝎 *Ananteris turumbanensis* González-Sponga, 1990 [San Martín de Turumbán, Bolívar State, Venezuela]^{lo}
 委内瑞拉无支蝎 *Ananteris venezuelensis* González-Sponga, 1972 [Venezuela]^{lo}
 佛氏无支蝎 *Ananteris volksenki* Botero-Trujillo, 2009 [Erich S. Volschenk]^{ep}
 苏利亚无支蝎 *Ananteris zuliana* González-Sponga, 2006 [Zulia State, Venezuela]^{lo}
- 似无支蝎属 Genus *Ananteroides* Borelli, 1911 [*Ananteris* + *-oides* (resembling)]^{ta}
- 斐氏似无支蝎 *Ananteroides feae* Borelli, 1911 [Leonardo Fea]^{ep}
- 意外似无支蝎 *Ananteroides inexpectatus* Lourenço, 2013 [unexpected]^{ax}
- 杀人蝎属 Genus *Androctonus* Ehrenberg, 1828 [*andro* (man) + *-ctonus* (killer)]^{er}
- 英雄杀人蝎 *Androctonus aeneas* C. L. Koch, 1839 [Αἰνείας (Aeneas), a Trojan hero]^{my}
- 阿富汗杀人蝎 *Androctonus afghanus* Lourenço & Qi, 2006 [Afghanistan]^{lo}
- 哈桑尼亚杀人蝎 *Androctonus agrab* Ythier & Lourenço, 2022 [*agrab*, Arabic dialect Hassāniyya for "scorpion"]^{au}
- 阿莱氏杀人蝎 *Androctonus aleksandrplotkini* Lourenço & Qi, 2007 [Aleksandr Plotkin]^{ep}
- 阿氏杀人蝎 *Androctonus amoreuxi* (Audouin, 1826)
- 模式亚种 *A. amoreuxi amoreuxi* (Audouin, 1826) [Pierre-Joseph Amoreux]^{ep}
- 利氏亚种 *A. amoreuxi levyi* Fet, 1997 [Gershom Levy]^{ep}
- 南方杀人蝎 *Androctonus australis* (Linnaeus, 1758) [southern (*auster* (south) + *-alis* (pertaining to))]^{cho}
- 俾路支杀人蝎 *Androctonus baluchicus* (Pocock, 1900) [Baluchistan Province, now in Pakistan]^{lo}
- 布氏杀人蝎 *Androctonus bourdoni* Vachon, 1948 [Bourdon]^{ep}
- 巴伯氏杀人蝎 *Androctonus barbouri* (Werner, 1932) [nomen dubium] [Thomas Barbour]^{ep}
- 双色杀人蝎 *Androctonus bicolor* Ehrenberg, 1828
- 模式亚种 *A. bicolor bicolor* Ehrenberg, 1828 [two-colored]^{mo}
- 长棱亚种 *A. bicolor longecarinatus* (Di Caporiacco, 1932) [nomen dubium] [*longe-* (long) + *carin-* (carina) + *-atus* (with)]^{mo}
- 布基纳法索杀人蝎 *Androctonus burkinensis* Ythier, 2021 [Burkina Faso]^{lo}
- 乔里斯坦杀人蝎 *Androctonus cholistanus* Kovařík & Ahmed, 2013 [Cholistan Desert, Punjab Province, Pakistan]^{lo}
- 肥尾杀人蝎 *Androctonus crassicauda* (Olivier, 1807) [*crassi-* (fat, thick) + *cauda* (tail)]^{mo}
- 德氏杀人蝎 *Androctonus dekeyseri* Lourenço, 2005 [Pierre Louis Dekeyser]^{ep}
- 多氏杀人蝎 *Androctonus donairei* Rossi, 2015 [David Donaire Barroso]^{ep}
- 乳色杀人蝎 *Androctonus eburneus* (Pallary, 1928) [*ivory-colored* (*ebur* (ivory, elephant) + *-eus* (made of, having the quality of))]^{chr}
- 亲缘杀人蝎 *Androctonus initimus* (Pocock, 1897) [neighboring, closely related, alike (*ini-* (end, border))]^{ta}
- 贡氏杀人蝎 *Androctonus gonneti* Vachon, 1948 [Gonnet]^{ep}
- 霍加尔杀人蝎 *Androctonus hoggarensis* (Pallary, 1929) [Mt. Hoggar, Algeria]^{lo}
- 留氏杀人蝎 *Androctonus liouvillei* (Pallary, 1924) [Jacques Liouville]^{ep}
- 迈氏杀人蝎 *Androctonus maelfaiti* Lourenço, 2005 [Jean-Pierre Maelfait]^{ep}
- 毛里塔尼亚杀人蝎 *Androctonus mauritanicus* (Pocock, 1902) [either the Kingdom of Mauretania or the Roman province, Mauretania Tingitana]^{pal}
- 摩洛哥杀人蝎 *Androctonus maroccanus* Lourenço, Ythier & Leguin, 2009 [Morocco]^{lo}
- 淡色杀人蝎 *Androctonus pallidus* Lourenço, Duhem & Cloudsley-Thompson, 2012 [*pall-* (pale) + *-idus* (tending to)]^{chr}
- 强壮杀人蝎 *Androctonus robustus* Kovařík & Ahmed, 2013 [strong, robust]^{mo}
- 珊氏杀人蝎 *Androctonus santi* Lourenço, 2015 [Sebastian Sant]^{ep}
- 瑟氏杀人蝎 *Androctonus sergenti* Vachon, 1948 [Etienne Sergent]^{ep}
- 西氏杀人蝎 *Androctonus simonettai* Rossi, 2015 [Alberto Mario Simonetta]^{ep}

桑塔丽塔拟尾戮蝎 *Pseudouroctonus santarita* Ayrey & Soleglad, 2015 [Santa Rita Mts., Arizona, USA]^{lo}

司氏拟尾戮蝎 *Pseudouroctonus sprousei* Francke & Savary, 2006 [Peter Sprouse]^{ep}

锯指蝎属 Genus *Serradigitus* Stahnke, 1974 [*serra-* (sawtooth) + *digitus* (here as “finger”)]^{mo}

阿氏锯指蝎 *Serradigitus adcocki* (Williams, 1980) [Richard Adcock]^{ep}

武齿锯指蝎 *Serradigitus armadentis* (Williams, 1980) [*arma-* (armed) + *dentis* (tooth)]^{mo}

鲍氏锯指蝎 *Serradigitus baueri* (Gertsch, 1958) [Harry Bauer]^{ep}

贝氏锯指蝎 *Serradigitus bechteli* (Williams, 1980) [Kenneth Bechtel]^{ep}

炎热锯指蝎 *Serradigitus calidus* (Soleglad, 1974) [*cal-* (hot) + *-idus* (tending to)]^{bi}

德氏锯指蝎 *Serradigitus dwyeri* (Williams, 1980) [Richard Dwyer]^{ep}

哲氏锯指蝎 *Serradigitus gertschi* (Williams, 1968)

模式亚种 *S. gertschi gertschi* (Williams, 1968) [Willis John Gertsch]^{ep}

线纹亚种 *S. gertschi striatus* (Hjelle, 1972) [*stri-* (stripe) + *-atus* (with)]^{chr}

希甘塔锯指蝎 *Serradigitus gigantaensis* (Williams, 1980) [Sierra de la Giganta Mts., Baja California Sur State, Mexico]^{lo}

草地锯指蝎 *Serradigitus gramenestris* (Williams, 1970) [*gramen* (grass) + *-estrus* (pertaining to)]^{bi}

哈氏锯指蝎 *Serradigitus haradoni* (Williams, 1980) [Richard M. Haradon]^{ep}

亥氏锯指蝎 *Serradigitus hearnei* (Williams, 1980) [Thomas Powell Hearne]^{ep}

约书亚锯指蝎 *Serradigitus joshuaensis* (Soleglad, 1972) [Joshua Tree National Monument, California, USA]^{lo}

海岸锯指蝎 *Serradigitus littoralis* (Williams, 1980) [*littoral-* (shore) + *-alis* (pertaining to)]^{bi}

渺小锯指蝎 *Serradigitus minutis* (Williams, 1970) [diminished, perfect passive participle of *minuo* (diminish)]^{mo}

密氏锯指蝎 *Serradigitus miscionei* Ayrey, 2011 [Tom Miscione]^{ep}

太平洋锯指蝎 *Serradigitus pacificus* (Williams, 1980) [Pacific Ocean]^{lo}

灼热锯指蝎 *Serradigitus torridus* Williams & Berke, 1986 [*torr-* (scorch, parch) + *-idus* (tending to)]^{bi}

伍帕特基锯指蝎 *Serradigitus wupatkiensis* (Stahnke, 1940) [Wupatki National Monument, Arizona, USA]^{lo}

雅基锯指蝎 *Serradigitus yaqui* Sissom & Stockwell, 1991 [Yaqui Indians who lived near Yaqui River Valley, Sonora State, Mexico]^{et}

鬃尾蝎属 Genus *Smelingurus* Haradon, 1983 [*smeling-* (bristle, hair) + *urus* (tail)]^{mo}

旱地鬃尾蝎 *Smelingurus aridus* (Soleglad, 1972) [dry, arid]^{bi}

大鬃尾蝎 *Smelingurus grandis* (Williams, 1970) [grand]^{mo}

梅萨鬃尾蝎 *Smelingurus mesaensis* (Stahnke, 1957) [Mesa, a city in Arizona, USA]^{lo}

瓦氏鬃尾蝎 *Smelingurus vachoni* (Stahnke, 1961) [Max Vachon]^{ep}

斯氏蝎属 Genus *Stahnkeus* Soleglad & Fet, 2006 [Herbert Ludwig Stahnke]^{ep}

奥氏斯氏蝎 *Stahnkeus allredi* (Sissom & Stockwell, 1991) [Donald M. Allred]^{ep}

漠栖斯氏蝎 *Stahnkeus deserticola* (Williams, 1970) [*deserti-* (desert) + *-cola* (dweller)]^{bi}

哈氏斯氏蝎 *Stahnkeus harbisoni* (Williams, 1970) [Charles Francis Harbison]^{ep}

珀氏斯氏蝎 *Stahnkeus polisi* (Sissom & Stockwell, 1991) [Gary Allan Polis]^{ep}

细螯斯氏蝎 *Stahnkeus subtilimanus* (Soleglad, 1972) [*subtili-* (fine, thin) + *manus* (hand)]^{mo}

合棱蝎属 Genus *Syntropis* Kraepelin, 1900 [*syn-* (joint) + *tropis* (keel), refers to the single ventromedian carina on metasoma I-IV]^{mo}

阿氏合棱蝎 *Syntropis aalbui* Lowe, Soleglad & Fet, 2007 [Rolf Lionel Aalbu]^{ep}

长尾合棱蝎 *Syntropis macrura* Kraepelin, 1900 [*macr-* (long) + *ura* (tail)]^{mo}

威氏合棱蝎 *Syntropis williamsi* Soleglad, Lowe & Fet, 2007 [Stanley C. Williams]^{ep}

托氏蝎属 Genus *Thorellius* Soleglad & Fet, 2008 [Tord Tamerlan Teodor Thorell]^{ep}

脊螯托氏蝎 *Thorellius cristimanus* (Pocock, 1898) [*cristi-* (keel) + *manus* (hand)]^{mo}

无畏托氏蝎 *Thorellius intrepidus* (Thorell, 1876) [fearless]^{er}

凶蛮托氏蝎 *Thorellius tekuani* González-Santillán & Prendini, 2018 [Nahuatl for “ferocious”]^{au(er)}

维拉利卡托氏蝎 *Thorellius wixarika* González-Santillán & Prendini, 2018 [endonym used by the Huichol people of the central and western Sierra Madre Occidental, Mexico]^{et}

黑黍托氏蝎 *Thorellius yuyuawi* González-Santillán & Prendini, 2018 [Wixarika for “grains of black maize”, refers to the color and smoothness of the integument, especially the chelae]^{au(mo)}

近尾戮蝎属 Genus *Uroctonites* Williams & Savary, 1991 [*Uroctonus* + *-ites* (suffix indicating relationship)]^{ta}

吉氏近尾戮蝎 *Uroctonites giulianii* William & Savary, 1991 [Derham Giuliani]^{ep}

华楚卡近尾戮蝎 *Uroctonites huachuca* (Gertsch & Soleglad, 1972) [Huachuca Mts., Arizona, USA]^{lo}

蒙特雷近尾戮蝎 *Uroctonites montereus* (Gertsch & Soleglad, 1972) [Monterey Country, California, USA]^{lo}

红杉近尾戮蝎 *Uroctonites sequoia* (Gertsch & Soleglad, 1972) [Sequoia National Park, California, USA]^{lo}

愈神蝎属 Genus *Vaejovis* C. L. Koch, 1836 [Vaejovis, god of healing in Roman mythology]^{de}

阿华萨塔愈神蝎 *Vaejovis aguazarca* Díaz-Plascencia & González-Santillán, 2022 [Agua Zarca Biological Station, Sierra Fría, San José de Gracia Municipality, Aguascalientes, Mexico]^{lo}

 维氏蝎属 Genus *Wernerius* Soleglad & Fet, 2008
 合棱蝎亚科 Subfamily *Syntropinae* Kraepelin, 1905
 光滑巴尔萨斯蝎属 Genus *Balsateres* González-Santillán & Prendini, 2013
 奇瓦瓦蝎属 Genus *Chihuahuanus* González-Santillán & Prendini, 2013
 科氏蝎属 Genus *Kochius* Soleglad & Fet, 2008
 微纳瓦蝎属 Genus *Konetontli* González-Santillán & Prendini, 2013
 布雷佩查蝎属 Genus *Kuarapu* Francke & Ponce-Saavedra, 2010
 战神蝎属 Genus *Maaykuyak* González-Santillán & Prendini, 2013
 中墨愈神蝎属 Genus *Mesomexovis* González-Santillán & Prendini, 2013
 副愈神蝎属 Genus *Paravaejovis* Williams, 1980
 合棱蝎属 Genus *Syntropis* Kraepelin, 1900
 托氏蝎属 Genus *Thorellius* Soleglad & Fet, 2008
 维齐诺蝎属 Genus *Vizcaino* González-Santillán & Prendini, 2013
 愈神蝎亚科 Subfamily *Vaejovinae* Thorell, 1876
 卡特琳娜岛蝎属 Genus *Catalinia* Soleglad, 2017
 弗氏蝎属 Genus *Franckeus* Soleglad & Fet, 2005
 格氏蝎属 Genus *Graemeloweus* Soleglad, Fet, Graham & Ayrey, 2016
 寇氏蝎属 Genus *Kovarikia* Soleglad, Fet & Graham, 2014
 拟尾戮蝎属 Genus *Pseudouroctonus* Stahnke, 1974
 近尾戮蝎属 Genus *Uroctonites* Williams & Savary, 1991
 愈神蝎属 Genus *Vaejovis* C. L. Koch, 1836

*Uroctoninae, Heteroscorpionidae, Typhlochactidae and Troglotayosicidae were considered as *incertae sedis* by Santibáñez-López et al. (2019); I tentatively included them in the above classification according to the previous studies. No subfamilies or tribes are considered for Chactidae in this paper; for previous considerations, see Soleglad & Fet (2004, 2005).
